

Specialists in Seals & Service

i-tech Seals Inc.

O-Ring Design Guide

Introduction

In 1990, Hi-Tech Seals was founded in Edmonton, Alberta. Since then, our company expanded to six locations across Canada and one location in the United States.

We are an industrial seal, gasket, rubber and plastic component distributor and manufacturer. We focus on providing superior value to our customers. We continually invest in new and innovative products, services, and equipment with the intention of helping our customers grow and prosper in an ever-changing world economy.

We offer a personal solution to the business world, tailoring our business relationship to reflect the needs of our clients. We work alongside a variety of industries, while maintaining a high-quality standard in all our products. Our diverse supply chain allows our customers to be confident we will provide a solution that exceeds their needs.

Seal Kits

Hi-Tech Seals kit creation program provides customers with an easy to use reordering system for various types of seal kits. Whether its for maintenance or manufactured equipment our sales staff will identify the sealing components and create a kit in our system. The kit can include custom labels with company name and logos, part numbers, and application information. When placing an order, simply provide us with the kit number and receive the parts in one bag.

ISO 9001 Registered QMS

We are committed to our Quality Management System (QMS). Hi-Tech Seals registered our first branch under an ISO QMS in 1996. Now, all our locations and divisions are registered under the ISO QMS. The four main goals of our policy include:

- Hi-Tech Seals shall distribute and/or manufacture a quality product that will meet our customers' requirements and expectations.
- Hi-Tech Seals shall strive to continually improve the effectiveness of the Quality Management System.
- Hi-Tech Seals' Quality Policy shall be communicated and understood at all levels of the organization.
- Hi-Tech Seals' Quality Policy and Quality Objectives will be reviewed for effectiveness and accuracy during the Annual Management Review.

After Hours Service

We have a sales representative available 24 hours a day, 7 days a week. An after-hours sales representative can be reached by contacting your local branch.

Compound Specification Guide

Prefix	Material	Duro.	Temperature Range		Description
N70	Nitrile	70 ± 5	-40°C to 120°C -40°F to 248°F		A general service nitrile compound for a wide range of applications including petroleum based fluids. Nitrile compounds also have excellent resistance to compression set, tear and abrasion resistance.
N90	Nitrile	90 ± 5	-40°C to 120°C -40°F to 248°F		Generally used for higher pressures than the 70 durometer materials, while having comparable media resistance.
LTN	Nitrile	70 ± 5	-54°C to 120°C -65°F to 248°F		A low temperature nitrile compound for use in applications where sealability at lower temperatures is important. Due to the lower acrylonitrile content, this compound will show slightly less resistance to petroleum products.
HS7	Hydrogenated Nitrile	70 ± 5	-40°C to 160°C -40°F to 320°F		Hydrogenated nitrile provides an improved resistance to heat, ozone and aging. Similar applications to nitrile but with improved mechanical properties and media resistance. Excellent for many oilfield and automotive applications. H2S resistance up to 10%.
HS8	Hydrogenated Nitrile	80 ± 5	-40°C to 160°C -40°F to 320°F		Generally used for higher pressures than the 70 durometer materials while having comparable media resistance.
HS9	Hydrogenated Nitrile	90 ± 5	-40°C to 160°C -40°F to 320°F		Generally used for higher pressures than the 80 durometer materials while having comparable media resistance. Improved ED resistance.
V75	Viton™	75 ± 5	-26°C to 204°C -15°F to 400°F		Viton™ compounds have excellent resistance to ozone, weather, oxygen, mineral oil, fuels, hydraulic fluids, aromatics, petroleum fluids, many organic solvents and chemicals. Viton™ is also used in high temperature applications. Viton™ Extreme™ ETP compounds is also available. ETP- Provides the excellent thermal resistance of Viton™ along with significantly advanced chemical resistance.
V90	Viton™	90 ± 5	-26°C to 204°C -15°F to 400°F		Viton™ is generally used for higher pressure than the 75 durometer materials while having comparable media resistance.
LTV	Viton™ GLT	75 ± 5	-40°C to 204°C -40°F to 400°F		Viton™ GLT is used for lower temperature applications than the 75 durometer materials while having comparable media resistance.
PF7	Perfluoroelastomer	75 ± 5	-15°C to 310°C 5°F to 590°F		Perfluoroelastomer materials have the best heat and chemical resistance performance compared to other elastomer materials.
PF9	Perfluoroelastomer	90 ± 5	-15°C to 310°C 5°F to 590°F		Generally used for higher pressures than the 75 durometer materials while having comparable media resistance.
A80	Aflas® FEPM	80 ± 5	-9 °C to 232°C 16°F to 450°F		Tetrafluoroethylene-Propylene materials exhibit exceptional thermal and chemical resistance including hot water, steam, acids, alkaline solutions, ammonia, amines, brake fluids, petroleum fluids and sour gas. Low temperature may restrict sealing abilities.
NEO	Neoprene	70 ± 5	-40°C to 121°C -40°F to 250°F		Neoprene is a general purpose material for refrigerants, ozone and weather.
E70	Ethylene- Propylene	70 ± 5	-54°C to 150°C -65°F to 302°F		Ethylene-Propylene materials exhibit excellent resistance to water, steam, brake fluids and ozone.
E80	Ethylene- Propylene	80 ± 5	-54°C to 150°C -65°F to 302°F		Generally used for higher pressures than 70 durometer EPDM compounds while having comparable media resistance.
S70	Silicone	70 ± 5	-65°C to 232°C -85°F to 446°F		Silicone compounds offer the widest elastomer temperature range but typically cannot be used in dynamic applications or petroleum based fluids.
FS7	Fluorosilicone	70 ± 5	-56°C to 204°C -69°F to 400°F		Fluorosilicone has improved chemical resistance over silicone including oils, greases, & steam
TEV	PTFE Encapsulated Viton™		-60°C to 205°C -76°F to 401°F		
TES	PTFE Encapsulated Silicone		-60°C to 205°C -76°F to 401°F		

F.D.A., NSF and UL listed or approved materials available upon request. We also offer a complete range of coloured or internally lubed compounds as required. Some materials are available in durometers that range from 40 to 95 shore A. Most compounds available in metric sizing. Hi-Tech Seals Inc. also offers a complete range of back-up rings, anti-extrusion devices as well as X-rings and square cut rings. These products are available in a variety of sizes and materials, please contact your sales office for more information.

O-Ring Cross-Section

The I.D. and O.D. of an O-ring gland is primarily influenced by diameter of the mating surface of the rod or piston and bore. Although the cross-section of the O-ring is seen as fairly arbitrary, there are some distinct advantages to either a larger or smaller cross-section O-ring. Listed below are the advantages of small cross-sections and the advantages of large cross-sections:

Advantages of Smaller Cross-Section

- More compact
- Lighter weight
- Less expensive; especially for higher cost elastomers like FKM or fluorosilicone
- Less machining required for machined grooves since grooves are smaller
- Increased resistant to explosive decompression

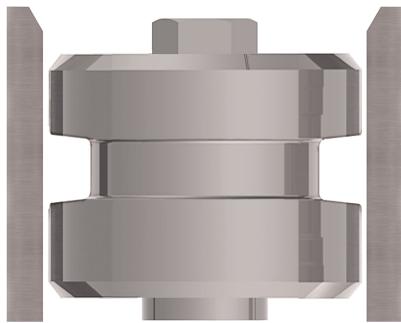

Advantages of Larger Cross-Section

- Less prone to compression set
- Less volume swell in liquid on a percentage basis
- Allows for larger tolerance while still maintaining acceptable compression squeeze and compression ratio over full stack-up range
- Less prone to leakage due to contamination; dirt, lint, scratches, etc.

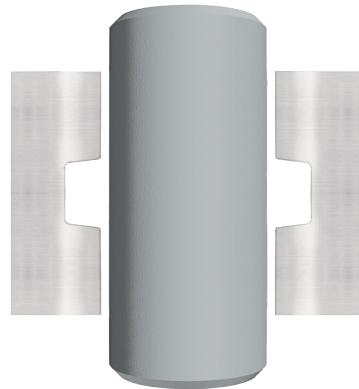

O-Ring Gland Types

O-rings are primarily used to prevent the loss of a fluid or gas. However, O-rings can be used as dust seals, drive belts or on rotating shafts. Most O-ring seals can be classified into one of the three arrangements shown below.

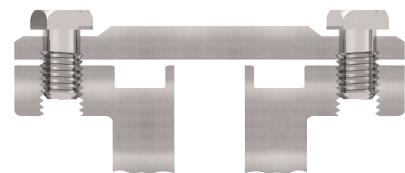

Piston Configuration

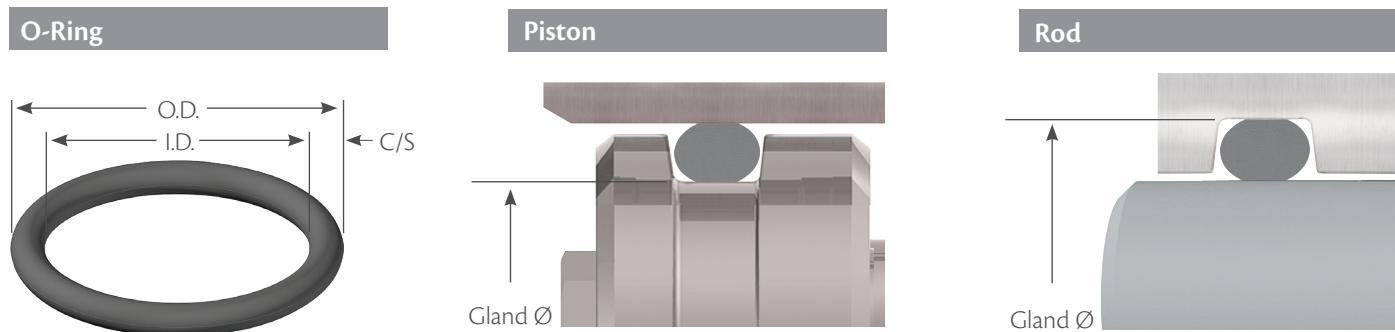

Rod Configuration

Face Type Configuration

I.D. Stretch/O.D. Interference

For hydraulic and pneumatic piston sealing applications

The O-ring I.D. should be stretched between 2% and 5% for dynamic applications and 2% and 8% for static applications. For O-rings with an I.D. smaller than 20 mm, this is not always possible which can result in a wider range of stretch. To minimize this range and the maximum stretch, it is necessary to minimize the tolerance of the piston gland diameter, and have a less stringent requirement for the minimum O-ring stretch. In dynamic applications, it is important to keep the maximum stretch to 5% or less to avoid detrimental effects on sealing performance.

For hydraulic and pneumatic rod sealing applications

The O-ring O.D. should be equal to or larger than the rod gland diameter to give interference on the O-ring O.D. The O-ring O.D. should not exceed 3% of the rod gland diameter for O-rings with an I.D. greater than 250 mm, or 5% for O-rings with an I.D. smaller than 250 mm. For O-rings with an I.D. smaller than 20 mm, this is not always possible due to tolerance issues, which can result in a greater O-ring O.D. interference.

Machining Specifications

O-Ring Design Guide

O-Ring Selection

Reduction in Cross-Section

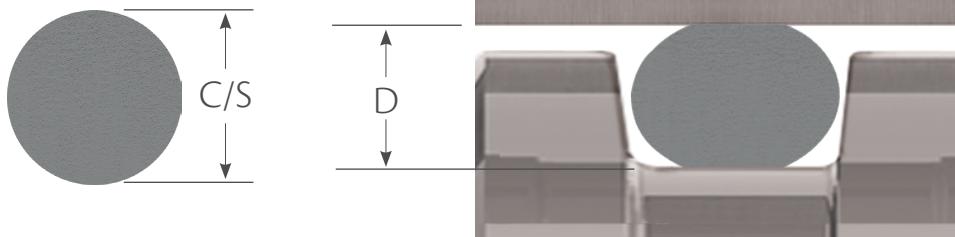

If the I.D. of the O-ring is stretched, the cross-section of the O-ring will decrease. The following table gives the O-ring cross-sections that result from various percentages of I.D. stretch.

O-Ring Series	Original O-Ring C/S		Reduced O-Ring C/S at % ID Stretch (Inch/mm)				
	Inch	mm	1%	2%	3%	4%	5%
000	0.070	1.78	0.069/1.76	0.069/1.74	0.068/1.73	0.068/1.71	0.068/1.69
100	0.103	2.62	0.102/2.59	0.101/2.57	0.100/2.54	0.100/2.52	0.100/2.49
200	0.139	3.53	0.138/3.49	0.137/3.46	0.136/3.42	0.135/3.39	0.134/3.35
300	0.210	5.33	0.208/5.28	0.206/5.22	0.205/5.17	0.204/5.12	0.203/5.06
400	0.275	6.99	0.272/6.92	0.270/6.85	0.268/6.78	0.267/6.71	0.266/6.64

Compression

Compression squeeze is the difference between the original O-ring cross-section and the final O-ring cross-section once installed.

Compression Squeeze

$$\text{Compression Squeeze} = C/S - D$$

This can usually be expressed as a percentage: $\text{O-ring C/S Squeeze (\%)} = \frac{\text{Compression Squeeze}}{C/S} \times 100$

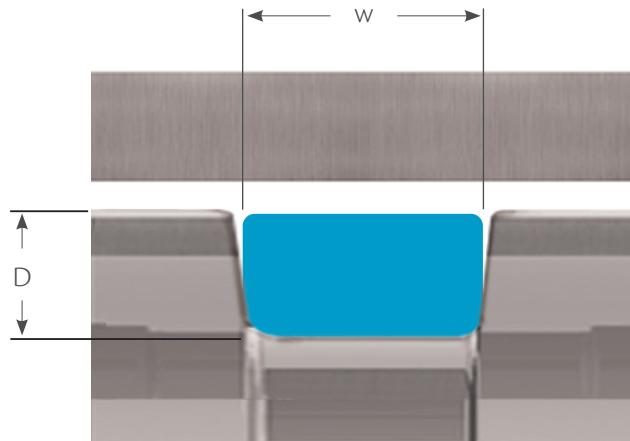

For recommended O-ring C/S squeeze (%) values please refer to page 11-12.

Gland Fill

The gland fill is the percentage of the gland that is occupied by the O-ring. It is calculated by dividing the cross-sectional area (CSA) of the O-ring by the cross-sectional area of the gland.

$$\text{Area of a circle} = \pi r^2 \text{ and } r = \frac{d}{2}, \text{ where } d = \text{diameter (C/S)}$$

$$\text{Therefore, O-ring CSA} = \pi \left(\frac{C/S}{2} \right)^2$$

$$\text{Gland CSA} = D \times w^*$$

$$\text{Gland Fill (\%)} = \frac{\text{O-ring CSA}}{\text{Gland CSA}} \times 100$$

** Effect of gland angle and extrusion gap not addressed.*

w- groove width, D- groove depth

It is important to consider the groove fill or occupancy of the installed O-ring to avoid detrimental effects on radial sealing performance. Groove fill of the installed O-ring should not exceed 85 % to allow for possible O-ring thermal expansion, volume swell due to fluid exposure and effects of tolerances.

Volume change is the increase or decrease of the volume of an elastomer after it has been in contact with a fluid, measured in percent (%). For static O-ring applications volume swell up to 30 % can usually be tolerated. For dynamic applications, 10 or 15 % swell is a reasonable maximum unless special provisions are made in the gland design itself. This is a general rule and there may occasionally be exceptions.

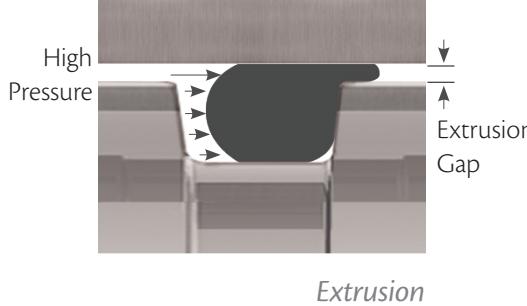

It is also important to note there are significant differences in the coefficients of thermal expansion between the O-ring material and the groove materials. Elastomers can have coefficients of thermal expansion **7 to 20 times higher** than that of metal, such as steel.

Extrusion Gap

Extrusion is a concern for radial seals where there is gap between the piston and the bore for a piston type seal or between the rod and the bore for a rod type seal. It is not typically a concern for face type seals where the metal parts to be sealed are in contact line-to-line. The issue is that at higher pressures and especially for softer O-ring elastomers, the O-ring can be forced by the pressure into the small gap between the piston (or rod) and the bore. Unless the bore and the piston (or rod) are ensured to remain concentric by the hardware, we have to assume that entire possible gap can shift to one side (see diagram below).

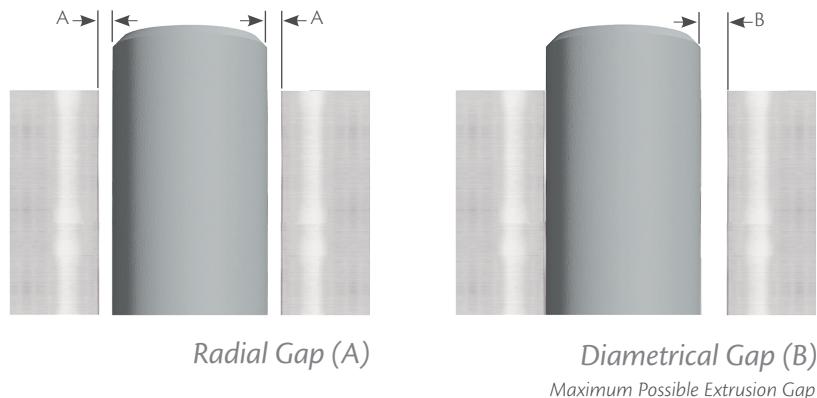

Piston Type Seal

$$\text{Radial Extrusion Gap} = \frac{\text{Bore Ø} - \text{Piston Ø}}{2}$$

Rod Type seal

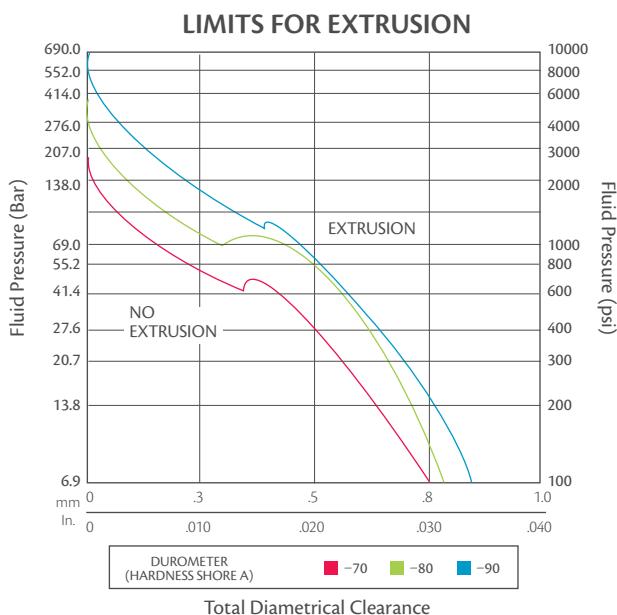

$$\text{Radial Extrusion Gap} = \frac{\text{Bore Ø} - \text{Rod Ø}}{2}$$

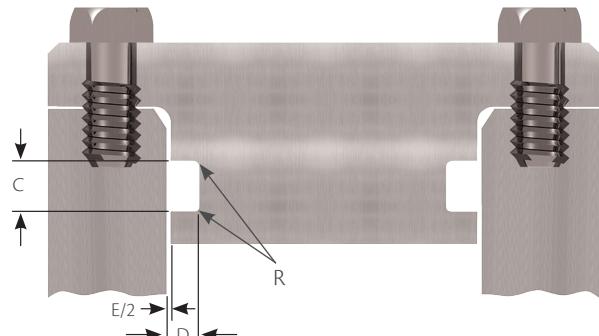

Limits for Extrusion

There are different methods to counter O-ring extrusion. One of these methods is to increase the durometer rating of the O-ring. However, as the durometer is increased, the O-ring can become less malleable. Another option would be the use of anti-extrusion devices. These are thin rings made of hard plastic materials such as PTFE, nylon, and PEEK. Once in place these rings will provide essentially zero clearance.

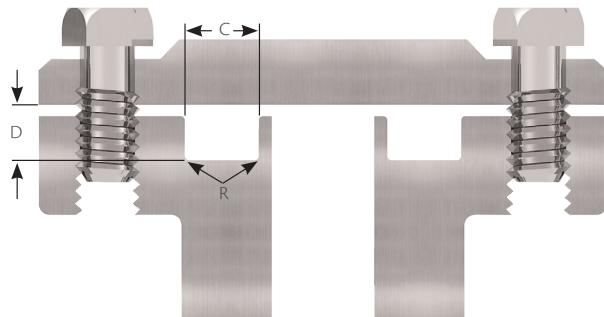

Reduce the clearance shown by 60% when using silicone or fluoro-silicone elastomers.

Surface Finish

The surface roughness of the O-ring gland and any mating part has a significant impact on the life and sealing performance of the O-ring. The following are general fluid sealing surface roughness values in microinches (μinch):

For a static mating surface: Ra 16-32 μinch

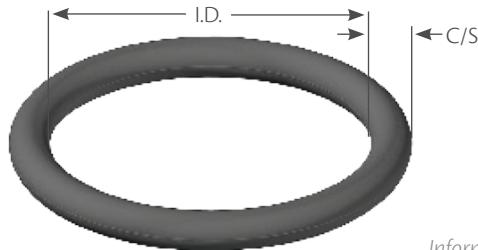

For a dynamic mating surface: Ra 8-16 μinch

We offer O-rings in sizes ranging from 400-424. These O-ring size dimensions and tolerances are unassigned under ISO 3601. In addition, Hi-Tech Seals stocks specific non-standard cross-section O-rings such as 3/8", 1/2" and 3/4".

Extrusion (Nibbling)

Description: The seal develops ragged edges, generally on the low-pressure side, which appear tattered.

Contributing Factors: Excessive clearances, excessive pressure, low modulus/hardness elastomer, excessive gland fill, irregular clearance gaps, sharp gland edges, improper sizing.

Suggested Solutions: Decrease clearances, higher-modulus/hardness elastomer, proper gland design, use of polymer backup rings.

Over-Compression

Description: The seal exhibits parallel flat surfaces (corresponding to the contact areas) and may develop circumferential splits within the flattened surfaces.

Contributing Factors: Improper design-failure to account for thermal or chemical volume changes, or excessive compression.

Suggested solutions: Gland design should take into account material responses to chemical and thermal environments.

Spiral Failure

Description: The seal exhibits cuts or marks which spiral around its circumference.

Contributing Factors: Difficult or tight installation (static), slow reciprocating speed, low-modulus/hardness elastomer, irregular O-ring surface finish, (including excessive parting line), excessive gland width, irregular or rough gland surface finish, inadequate lubrication.

Suggested Solutions: Correct installation procedures, higher-modulus elastomers, internally lubed elastomers, proper gland design, gland surface finish of 8-16 microinch RMS, possible use of polymer backup rings.

Compression Set

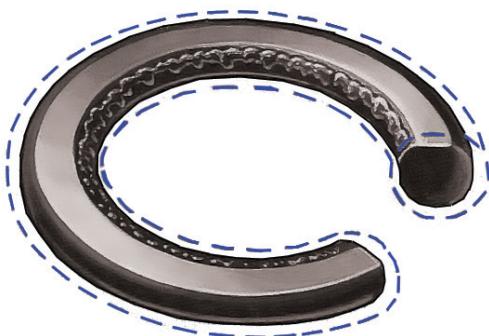

Description: The seal exhibits a flat-sided cross-section, the flat side corresponds to the mating seal surfaces.

Contributing Factors: Excessive compression, excessive temperature, incompletely cured elastomer, elastomer with high compression set, excessive volume swell in chemical.

Suggested Solutions: Low compression set elastomer, proper gland design for the specific elastomer, confirm material compatibility.

Outgassing/Extraction

Description: The seal may exhibit a decrease in cross-sectional size. The failure is often very difficult to detect from examination of the seal.

Contributing Factors: Improper or improperly cured elastomer, high vacuum levels, low hardness/plasticized elastomer.

Suggested Solutions: Avoid plasticized elastomers, ensure all seals are properly post-cured to minimize outgassing.

Installation Damage

Description: The seal or parts of the seal may exhibit small cuts, nicks, or gashes.

Contributing Factors: Sharp edges on the glands or components, improper sizing of elastomer, low-modulus/hardness elastomer, elastomer surface contamination.

Suggested Solutions: Remove all sharp edges. Proper gland design, proper elastomer sizing, higher-modulus/hardness elastomer.

Chemical Degradation

Description: The seal may exhibit many signs of degradation including blisters, cracking, voids or discoloration. In some cases, the degradation is observable only by measurement of physical properties.

Contributing Factors: Incompatibility with the chemical and/or thermal environment.

Suggested Solutions: Selection of a more chemically resistant elastomer.

Thermal Degradation

Description: The seal may exhibit radial cracks located on the highest temperature surfaces. In addition, certain elastomers may exhibit signs of softening-a shiny surface as a result of excessive temperatures.

Contributing Factors: Elastomer thermal properties, excessive temperature excursions or cycling.

Suggested Solutions: Selection of an elastomer with improved thermal stability, evaluation of the possibility of cooling sealing surfaces.

Explosive Decompression

Description: The seal exhibits blisters, pits or pocks on its surface. Absorption of gas at high pressure and the subsequent rapid decrease in pressure. The absorbed gas blisters and ruptures the elastomer surface as the pressure is rapidly removed.

Contributing Factors: Rapid pressure changes, low-modulus hardness elastomer.

Suggested Solutions: Higher-modulus/hardness elastomer, slower decompression (release of pressure).

Plasma Degradation

Description: The seal often exhibits discolouration, as well as powdered residue on the surface and possible erosion of the elastomer in the exposed area.

Contributing Factors: Chemical reactivity of the plasma, ion bombardment (sputtering), electron bombardment (heating), improper gland design, incompatible seal material.

Suggested Solutions: Plasma-compatible elastomer and compound, minimize exposed area, examine gland design.

Contamination

Description: The seal exhibits foreign materials on the surface and/or within the O-ring.

Contributing Factors: Process environment deposition, reactions or degradation of the elastomer, non-semiconductor-grade elastomer.

Suggested Solutions: Specify contamination level including manufacturing and packaging of the seals.

Abrasion

Description: The seal or parts of the seal exhibit a flat surface parallel to the direction or motion. Loose particles and scrapes may be found on the seal surface.

Contributing Factors: Rough sealing surfaces, excessive temperature, process environment containing abrasive particles, dynamic motion, poor elastomer surface finish.

Suggested Solutions: Use recommended gland surface finishes, consider internally lubed elastomers, eliminate abrasive components.

Chloroprene (CR) (Neoprene - DowDuPont™)

-40°C to 121°C

-40°F to 250°F

- Has exceptional ozone, weather, and good chemical resistance
- Good mechanical properties are retained over a wide temperature range
- Exhibits good resistance to refrigerants (R12)
- Commonly used with ammonia
- Poor resistance to aromatic hydrocarbons, polar solvents, and toluene

Ethylene Propylene (EPDM, EPR)

-54°C to 150°C

-65°F to 302°F

- Excellent resistance to ozone, hot water, steam, and aging
- Commonly used with brake fluids and refrigerants
- Poor resistance to petroleum fluids and mineral oils

Fluorocarbon (FKM, FPM) (Viton™ - Chemours)

-26°C to 204°C

-15°F to 400°F

- Excellent resistance to higher temperatures, petroleum oils, and gasoline
- Wide range of chemical resistance
- Very good ozone, weather, and aging resistance
- Poor compatibility with H₂S over 2%, amines, acetone, hot water, and steam
- Poor low temperature characteristics
- Low temperature fluorocarbons are available with a minimum temperature of -40°C/-40°F

Viton™ Extreme™ (FEP, FKM) (Viton™ - Chemours)

-20°C to 204°C

-4°F to 400°F

- Viton™ Extreme™ is a fluorocarbon compound that exhibits significantly improved performance over regular Viton™
- Provides the excellent thermal resistance along with significantly advanced chemical resistance

Fluorosilicone (FVMQ, FMQ)

-56°C to 204°C

-69°F to 400°F

- Wide temperature range
- Excellent resistance to hydrocarbon fuels, petroleum oils, and silicone oils
- Relatively low tear strength, abrasion resistance, and tensile strength
- Generally not suited for dynamic applications

Hydrogenated Nitrile (HNBR)

-40°C to 160°C

-40°F to 320°F

- A nitrile based compound with improved chemical resistance
- Wider temperature range than standard nitrile
- High strength material that resists extrusion, abrasion, and wear
- Water and steam resistance to +149°C/+300°F
- H₂S resistance up to 10%
- Commonly used with petroleum oils and CO₂
- Not to be used with chlorinated hydrocarbons, polar solvents, or strong acids

Nitrile (NBR)

-40°C to 120°C

-40°F to 248°F

- Presently the most widely used elastomer in the seal industry
- Provides an exceptional balance of good mechanical properties, wear properties and chemical resistance
- Resistant to most mineral oils and greases
- Do not use with glycol-based brake fluids and strong acids
- Low temperature nitrile compound available with a minimum temperature of -54°C/65°F

Polyetheretherketone (PEEK) (Ketron® - Mitsubishi Chemical Advanced Materials)

-70°C to 260°C /

-94°F to 500°F

- High strength
- Able to retain its mechanical properties at high temperatures
- Commonly used for anti-extrusion purposes
- Do not use with hydrochloric, nitric, or sulphuric acids

Perfluoroelastomer (FFKM) (Kalrez® - DuPont)

-15°C to 310°C

+5°F to 590°F

- Broadest chemical resistance of any elastomeric material
- Combines the sealing integrity of elastomers with chemical resistance approaching that of PTFE
- Not suitable with liquid sodium and potassium, fluorinated solvents, and refrigerants
- High temperature compounds available up to 325°C/617°F
- Kalrez® 4079 - A low compression set 75 durometer compound with excellent chemical resistance, good mechanical properties and outstanding hot air aging properties.
- Kalrez® Spectrum™ 6380 - An 80 durometer compound specifically developed for chemical processes involving hot, aggressive amines; in addition it has excellent overall chemical resistance.
- Kalrez® Spectrum™ 7090 - A 90 durometer compound that is specifically targeted for use in applications requiring high hardness/higher modulus properties. This compound has excellent mechanical properties including compression set resistance and explosive decompression resistance.

Polyurethane (AU, EU)

-54°C to 105°C

-65°F to 220°F

- Thermoplastic elastomer with higher tensile strength, toughness, and wear resistance
- Good combination of hardness and elasticity
- Good low temperature flexibility
- Used in high pressure hydraulic systems where parts are subject to wear

Polytetrafluoroethylene (PTFE) (Teflon™ - Chemours)

-268°C to 232°C /

-450°F to 450°F

- Virtually universal chemical resistance
- Very low coefficient of friction
- Fillers such as bronze, moly, glass, and carbon are commonly added to alter mechanical properties

Silicone (VMQ)

-65°C to 232°C

-85°F to 450°F

- Excellent resistance to oxidation and ozone degradation
- Wide temperature range
- Most commonly used in static applications due to its poor tensile strength and wear resistance
- Popular for food and medical applications

FEPM (TFE/P) (Aflas® FEPM - Asahi Glass Co.)

-9°C to 232°C

16°F to 450°F

- Good high temperature capability
- Resistant to strong acids and bases, amines, solvents and hot water
- Found in numerous applications in the oilfield industry
- Poor low temperature performance and low resilience

Hytrel® (TPC- ET)(DuPont™)

-54°C to 149°C

-65°F to 300°F

- A thermoplastic elastomer able to handle high temperatures and hostile fluids
- Has excellent strength and toughness properties
- Demonstrates high resilience and flexibility which permits easier installation than PTFE materials
- Not suitable with water and phosphate fluids above +80°C/+176°F

* Material information provided is based on multiple reference sources that are accepted by industry and is intended to serve as a general guideline. Testing material in the application environment is highly recommended.
