# Foreword

This catalogue contains the standard assortment of SKF hydraulic seals and guides typically used in hydraulic cylinders. To provide the highest levels of quality and customer service, these products are available worldwide through SKF sales channels. For information about lead times and deliveries, contact your local SKF representative or SKF Authorized Distributor.

This catalogue reflects SKF's state-of-the-art technology and production capabilities as of 2012. The data contained within may differ from that shown in earlier catalogues because of redesign, technological developments, or revised calculation methods. SKF reserves the right to continually improve its products with respect to materials, design and manufacturing methods, some of which are driven by technological developments.

## Getting started

*Introduction to fluid power* provides an overview over hydraulic cylinder types and classification with reference to SKF customized solutions and standard assortment of hydraulic seals and guides. The first chapter contains general technical information. Seal counter-surface finish properties, materials, fluid media and gap extrusion are discussed in detail. Furthermore product storage and installation information is included.

## Guidance values

Since several factors simultaneously affect the sealing system and seal performance, all stated values in graphs and tables in this publication should be considered as guidelines only and not as absolute values for practical applications.

## How best to use this catalogue

The catalogue follows an easy principle:

- *Introduction to fluid power* (→ **pages 12 to 18**) provides basic information about hydraulic seals.
- Chapter 1 (→ **pages 21 to 43**) provides general technical information, such as counter-surface finish properties, materials, fluid media.
- Chapters 2 to 6 provide product type specific information. A profile overview at the beginning shows the different profiles with a brief description and reference to more information inside the chapter. Product type and profile characteristics are discussed in detail. The profile data tables provide product specifications per profile followed by the relevant product tables with dimensions per item. At the end of the chapter more profiles of the specific type are outlined, including examples of the machined seal profiles manufactured with the SKF SEAL JET technology.
- Chapter 7 (→ **pages 347 to 351**) provides some information on other types of fluid power seals used both in hydraulic cylinder and other applications.
- Chapter 8 contains the product index (→ **page 352**) sorted by the profiles.

### Find product details quickly

Blue tabs on each right hand page show the chapter or product table number.

A quick way to access detailed product data is via the product table numbers. They are listed in the full table of contents at the front of the catalogue, in the table of contents of each product chapter and in the product index.

Profile	Description	Additional information → page
MPV	Polyurethane slide ring, nitrile rubber energizer; suitable for heavy duty applications	50
DPV	Polyurethane slide ring, nitrile rubber energizer; fits wide, shallow groove housings; suitable for heavy duty applications	51
LPV	Polyether-based polyurethane slide ring, nitrile rubber energizer; suitable for light to medium duty applications	51
CPV	Polyurethane slide ring, nitrile rubber energizer; suitable for light to medium duty applications	62

Numbered product table

### Colour coding for material

The product illustrations in this catalogue use a colour coding system to indicate the material group, but they do not match the actual material colours. For information about the actual material colours, refer to *Materials* (→ **page 26**).

### Consistent colour coding for material groups

 Thermoplastic polyurethane elastomer (TPU), moulded articles

 Thermoplastic polyurethane elastomer (TPU), machined articles

 Rubber

 Rigid thermoplastics

 Unfilled PTFE and other engineering plastics

 Filled PTFE

 Phenolic resins

 Polyester thermoplastic elastomers (TPC)

 Metal

### Units of measurement

This catalogue is for global use. Therefore, the predominant units of measurement are in accordance with ISO 80000-1. Imperial units are used whenever necessary. Unit conversions can be made using the conversion table (→ **page 4**).

For easier use, some values are provided in both metric and imperial values. Values are typically rounded. Therefore, the two values do not always match according to the conversion formula.

# This is SKF

From one simple but inspired solution to a misalignment problem in a textile mill in Sweden, and fifteen employees in 1907, SKF has grown to become a global industrial knowledge leader. Over the years we have built on our expertise in bearings, extending it to seals, mechatronics, services and lubrication systems. Our knowledge network includes 46 000 employees, 15 000 distributor partners, offices in more than 130 countries, and a growing number of SKF Solution Factory sites around the world.

## Research and development

We have hands-on experience in over forty industries, based on our employees' knowledge of real life conditions. In addition our world-leading experts and university partners who pioneer advanced theoretical research and development in areas including tribology, condition monitoring, asset management and bearing life theory. Our ongoing commitment to research and development helps us keep our customers at the forefront of their industries.

*SKF Solution Factory makes SKF knowledge and manufacturing expertise available locally, to provide unique solutions and services to our customers.*

## Meeting the toughest challenges

Our network of knowledge and experience along with our understanding of how our core technologies can be combined helps us create innovative solutions that meet the toughest of challenges. We work closely with our customers throughout the asset life cycle, helping them to profitably and responsibly grow their businesses.

## Working for a sustainable future

Since 2005, SKF has worked to reduce the negative environmental impact from our own operations and those of our suppliers. Our continuing technology development introduced the SKF BeyondZero portfolio of products and services which improve efficiency and reduce energy losses, as well as enable new technologies harnessing wind, solar and ocean power. This combined approach helps reduce the environmental impact both in our own operations and in our customers'.

*Working with SKF IT and logistics systems and application experts, SKF Authorized Distributors deliver a valuable mix of product and application knowledge to customers worldwide.*

# SKF – the knowledge engineering company

## Our knowledge – your success

*SKF Life Cycle Management is how we combine our technology platforms and advanced services, and apply them at each stage of the asset life cycle, to help our customers to be more successful, sustainable and profitable.*

### Working closely with you

Our objective is to help our customers improve productivity, minimize maintenance, achieve higher energy and resource efficiency, and optimize designs for long service life and reliability.

### Innovative solutions

Whether the application is linear or rotary or a combination of the two, SKF engineers can work with you at each stage of the asset life cycle to improve machine performance by looking at the

entire application. This approach doesn't just focus on individual components like bearings or seals. It looks at the whole application to see how each component interacts with the next.

### Design optimization and verification

SKF can work with you to optimize current or new designs with proprietary 3-D modeling software that can also be used as a virtual test rig to confirm the integrity of the design.

### **Bearings**

*SKF is the world leader in the design, development and manufacture of high performance rolling bearings, plain bearings, bearing units and housings.*

### **Machinery maintenance**

*Condition monitoring technologies and maintenance services from SKF can help minimize unplanned downtime, improve operational efficiency and reduce maintenance costs.*

### **Sealing solutions**

*SKF offers standard seals and custom engineered sealing solutions to increase uptime, improve machine reliability, reduce friction and power losses, and extend lubricant life.*

### **Mechatronics**

*SKF fly-by-wire systems for aircraft and drive-by-wire systems for off-road, agricultural and forklift applications replace heavy, grease or oil consuming mechanical and hydraulic systems.*

### **Lubrication solutions**

*From specialized lubricants to state-of-the-art lubrication systems and lubrication management services, lubrication solutions from SKF can help to reduce lubrication related downtime and lubricant consumption.*

### **Actuation and motion control**

*With a wide assortment of products – from actuators and ball screws to profile rail guides – SKF can work with you to solve your most pressing linear system challenges.*

# Introduction to fluid power

Fluid power systems transfer and utilize mechanical power through a working fluid. Energy is transmitted, stored and used through the transfer and pressure of fluids. By utilizing differential surface areas acted upon by the pressure of the working fluid, a mechanical advantage can be achieved. There are two main types of fluid power system:

- hydraulic – using liquid, such as oil, for the working fluid
- pneumatic – using gas, such as air, for the working fluid

Fig. 1

Double-acting hydraulic cylinder

# Hydraulic cylinders

A hydraulic cylinder is a linear actuator used to push or pull a load, or to selectively resist motion under load, by means of fluid pressure. Double-acting cylinders, the most common type, are able to push and pull (→ **fig. 1**). High pressure fluid pumped into the extend chamber (port “A”) acts on the piston to push the piston rod out, thereby extending the length of the cylinder. Inversely, to retract the piston rod and reduce the length of the assembly, high pressure fluid is pumped into the retract chamber (port “B”) and acts on the opposite side of the piston.

Other cylinder types are shown in **figure 2**. A cylinder which can only push but not pull is referred to as a single-acting cylinder. High pressure fluid is pumped into the extend chamber (port “A”) and acts on the piston to push the piston rod out. An external force is required to return the cylinder to the retracted position. A typical application for a single-act-

ing cylinder is a lift truck, where the load of the fork pushes the cylinder back. Multi-stage cylinders (also referred to as telescoping cylinders) have two or more piston rods in a coaxial arrangement to achieve greater extended length compared to the retracted length.

Fig. 2

## Cylinder classification

The type of cylinder and the application in which it's used are two of the main criteria to determine which seals and guides are selected. Applications are referred to as light duty, medium duty or heavy duty applications. These classifications are somewhat subjective but the duty levels are typically characterized by the following criteria.

### Light duty cylinders

Light duty cylinders, e.g. cylinders used for stationary equipment indoor in a factory environment, may be characterized by:

- system pressures up to 160 bar (2 300 psi)
- temperature up to 70 °C (160 °F)
- rare pressure peaks in excess of system pressure
- minimal side loads acting on guides
- environment with moderate temperature fluctuations and relatively free of contaminants

### Medium duty cylinders

Medium duty cylinders, e.g. cylinders in agriculture off-highway equipment, may be characterized by:

- system pressures up to 250 bar (3 625 psi)
- temperature up to 90 °C (195 °F)
- moderate pressure peaks in excess of system pressure
- moderate side loads acting on guides
- environment with temperature fluctuations with climate and typical external contaminants such as dust and moisture

### Heavy duty cylinders

Heavy-duty cylinders, e.g. cylinders in off-highway earthmoving or forestry equipment, may be characterized by:

- system pressures of 400 bar (5 800 psi) or more
- temperatures exceeding 90 °C (195 °F) with peaks in excess of 110 °C (230 °F)
- regular pressure peaks in excess of system pressure
- heavy side loads acting on guides, usually due to heavy components and/or high accelerations

- tough environment with wide temperature fluctuations and typical harsh external contaminants

## Hydraulic seals and guides

Hydraulic cylinder seals are used to seal the opening between various components in the hydraulic cylinder. **Figure 3** shows an example of the seal and guide components of a heavy duty cylinder. There are two main types of hydraulic seals in the system:

- **Dynamic seals**  
They seal between components in relative motion. In a hydraulic cylinder the rod sealing system seals dynamic reciprocating motion between the piston rod and head, while the piston sealing system seals dynamic reciprocating motion between the piston and cylinder bore.
- **Static seals**  
They seal between components fixed together without relative motion. Hydraulic cylinders use static seals in various locations depending on the design and construction. The most common are static seals between the piston and piston rod and between the head and cylinder bore tube.

Each dynamic seal in a hydraulic cylinder has a special function to contribute to the performance of the system:

### Piston seal functions

- act as pressure barrier and prevent fluid passing the piston – important for controlling the cylinder motion or maintaining the position when at rest

### Rod seal functions

- act as pressure barrier and keep the operating fluid inside the cylinder
- regulate the fluid film which extends with the surface of the piston rod – important to inhibit rod corrosion and to lubricate the wiper seal and the rod seal itself
- accept the lubrication film back into the cylinder when the rod retracts

### Buffer seal functions

- protect the rod seal from fluid pressure peaks in excess of system pressure
- attenuate the fluctuations in system pressure, thereby improving rod seal performance by allowing the rod seal to deal with more constant or gradually changing pressure
- act as an internal excluder to keep system contaminants, such as metal particles, from damaging the rod seal

### Wiper seal functions

- exclude external contaminants from entering the cylinder assembly and the hydraulic system
- accept the lubrication film back into the cylinder when the rod retracts

### Guide rings (rod and piston) functions

- prevent metal-to-metal contact between components
- react the radial load caused by side loads on the cylinder assembly
- keep the piston rod and piston accurately centred in the cylinder assembly – important for performance of the rod sealing system and piston sealing system

The subsequent chapters contain additional information regarding the function of each seal or guide in the system and the choices for each.

Fig. 3

## SKF hydraulic seals and guides capabilities

The SKF assortment of hydraulic seals comprises hundreds of different designs and material combinations. The products shown in this catalogue are the more commonly used seal profiles and sizes for hydraulic cylinders. The flexible SKF manufacturing systems and processes, combined with the industry's most agile and comprehensive design and engineering capability, allow additional profiles and sizes to be added on a daily basis. If application requirements are not served by the common profiles or sizes in this catalogue, contact SKF to provide a specific offer.

### Customized sealing solutions

In addition to the standard assortment of series-produced seals and sizes listed in this catalogue, SKF designs and manufactures hydraulic seals customized for virtually any requirements.

The design and development of high performance materials combined with testing and failure analysis are vital elements for successful seal development. SKF combines these elements with its extensive application knowledge, to offer solutions that are based on an understanding of sealing systems under various real conditions. SKF continuously develops new customized materials and designs and operates its own testing facilities around the world to provide optimized sealing solutions that meet the sophisticated demands of many industries.

#### Finite element analysis (FEA)

FEA is used to simulate the impact of operating conditions, material selection and seal design on seal behaviour (→ fig. 4).

## SKF SEAL JET system

The innovative production system SKF SEAL JET reduces manufacturing and dispatch time to a minimum. Virtually any kind of seal for any conceivable application, in any dimension and design, can be produced. SKF operates more than 200 machining centres worldwide and aims to be located as close to the customer as possible. With local and global application engineering teams and research and development centres, Machined seals (→ **fig. 5**) produced with SKF SEAL JET machines (→ **fig. 6**) can be customized to meet the most stringent sealing requirements of many industries. Key factors of the SKF SEAL JET systems (→ **fig. 7**) are:

- partnership with customers from the design phase to serial production with tailor made solutions
- prompt manufacturing of seals and components up to 4 000 mm (157 in.) in diameter as one piece and larger with short delivery times
- diameters up to 10 000 mm (395 in.) and larger by using a special welding technique
- virtually unlimited seal designs
- extensive range of sealing materials including materials certified to or complying with a broad range of industry standards and regulations (FDA, NSF, KTW, NORSOK, NACE, etc.)

## Criteria for seal selection

The selection of the right seal profile and material for a given application requires consideration of many factors. Furthermore, a sealing system, such as a rod sealing system, includes many components. This catalogue supports selection of the right seal for typical hydraulic seal applications and existing cylinder designs. For any application factors outside of the ordinary, or to specify sealing systems in new hydraulic cylinder designs, a certain amount of expertise, beyond the content of this catalogue, may be required. The hydraulic seal experts at SKF can assist in selecting the right seal system for new cylinder designs.

Before seals can be selected certain application parameters and information should be collected. The following most common application considerations are nearly always required when selecting hydraulic seals:

- fluid pressure range,  
the range of operating fluid system pressure, as well as frequency and severity of pressure peaks
- temperature range,  
the range of the fluid and cylinder assembly, both when operating and at rest
- speed,  
the stroking speed of the reciprocating piston rod
- fluid media,  
the type and viscosity of fluid used in the system
- hardware dimensions,  
the rod and bore diameters, seal groove dimensions and gaps (if already specified), cylinder overall length and stroke length as well as surface finish specifications (if already specified)
- application of the cylinder,  
the type of equipment the cylinder will be used on and what will the cylinder do in the equipment including mounting, duty cycle and environmental factors (external temperature, contaminants)

## Specifications for effective sealing systems

Designing hydraulic rod and piston sealing systems requires careful attention to the dynamic seal interaction and the principles of tribology to ensure long service life, proper seal function, minimal wear, low friction and smooth operation. Tribology is the study of the design, friction, wear and lubrication of interacting surfaces in relative motion. The most important considerations for tribological properties of a dynamic sealing system are:

- the seal material
- the seal profile design
- the counter-surface material and finish properties
- the hydraulic fluid, which is the lubrication for the dynamic seal surfaces

For information about seal profile design, see the relevant product chapter.

### Counter-surface finish properties

The surface properties of the cylinder bore and the piston rod have a great influence on

the function and service life of the seal. Parameters for specifying a surface finish are defined by ISO 4287. The most common surface roughness parameter specified is  $R_a$  (in units  $\mu\text{m}$  or  $\mu\text{in}$ ), i.e. the arithmetic mean deviation of the surface profile. This value does not, however, completely describe how the surface can be expected to affect the seal. The reason for this is that two surfaces with the same values of  $R_a$  but with different surface profile characteristics can result in a varying lubrication film thickness and, therefore, causing a very different degree of seal performance and wear.

The material ratio curve (Abbott-Firestone curve) provides more information about the surface profile characteristics. It describes the ratio of the material-filled length to the evaluation length at a given cutting depth expressed in percent ( $\rightarrow$  fig. 1). The slope at the beginning of the curve represents the peaks in the profile, which are causing initial wear on the seal. The slope at the end of the curve represents the valleys in the profile, which serve as lubricant reservoirs.

Fig. 1

Diagram 1

**Table 1** shows some surface profiles. Only the finished surface can serve as a seal counter-surface. To ensure a surface with suitable profile and characteristics for effective dynamic sealing, recommendations are given in a combination of the following surface parameters:

- $R_a$  – average roughness
- $R_z$  – mean roughness depth
- $R_{max}$  – maximum surface roughness
- $Rmr$  – material ratio

SKF recommends evaluating  $Rmr$  at a cutting depth of  $0,5 R_z$  based on  $c_{ref} = 0\%$  (→ **diagram 1**).

Table 1

Seal counter-surface examples

Surface profile	$R_a$	$R_z$	$R_{max}$	$Rmr$	Material ratio curve
–	$\mu\text{m}$	$\mu\text{m}$	$\mu\text{m}$	%	–
<p><b>Eroded surface</b></p>	2,4	7,3	10,4	≈ 40	
<p><b>Machined surface</b></p>	2,5	9,5	10,2	≈ 20 ... 25	
<p><b>Finished surface</b></p>	0,09	1,2	1,8	≈ 90	

## General technical information

### Recommendations for dynamic sealing surfaces

The dynamic sealing surfaces on the piston rod and in the cylinder bore (→ **fig. 2**) require similar, but somewhat different surface finishing.

#### Piston rod

The recommendations for the piston rod sealing surface (→ **table 2**) assume that typical materials and process are used to manufacture the piston rod by induction hardening carbon steel shaft, grinding, hard-chromium plating and then polishing to achieve the specified diameter and finish.

For alternative rod materials and coatings, other surface specifications, finishing methods, seal materials and designs may be required. Examples of such alternative rod coatings include:

- various hard metals applied by high velocity oxygen fuel (HVOF)
- ceramic coatings of various compositions and finishes
- stainless steel
- iron nitride

For recommendations for sealing systems with alternative rod materials and coatings, contact SKF.

Table 2

Recommendations for the dynamic sealing surface on piston rods (induction hardened and chrome plated rods)

	Thermoplastics and rubbers	PTFE materials
$R_a$	0,05 to 0,3 $\mu\text{m}$ (2 to 12 $\mu\text{in.}$ )	0,05 to 0,2 $\mu\text{m}$ (2 to 8 $\mu\text{in.}$ )
$R_z$	0,4 to 2,5 $\mu\text{m}$ (15 to 100 $\mu\text{in.}$ )	0,4 to 2 $\mu\text{m}$ (15 to 80 $\mu\text{in.}$ )
$R_{\text{max}}$	0,4 to 2,5 $\mu\text{m}$ (15 to 100 $\mu\text{in.}$ )	
$R_{\text{mr}}$	50 to 95% (cutting depth 0,5 $R_z$ based on $c_{\text{ref}} = 0\%$ )	
Hardness	$\geq 50$ HRC	
Hardening depth	-1,2 to 2,5 mm (-0.05 to 0.1 in.)	
Chromium layer thickness	-20 to 30 $\mu\text{m}$ (-0.0008 to 0.001 in.)	

Fig. 2

Table 3

**Recommendations for the dynamic sealing surface on cylinder bores**  
(honed or roller burnished tubes)

**Thermoplastics, rubbers and PTFE materials**

$R_a$	0,05 to 0,2 $\mu\text{m}$ (2 to 8 $\mu\text{in.}$ )
$R_z$	0,4 to 2 $\mu\text{m}$ (15 to 80 $\mu\text{in.}$ )
$R_{\text{max}}$	0,4 to 2,5 $\mu\text{m}$ (15 to 100 $\mu\text{in.}$ )
$R_{\text{mr}}$	50 to 95% (cutting depth 0,5 $R_z$ based on $c_{\text{ref}} = 0\%$ )

### Cylinder bore

The recommendations for the cylinder bore surface ( $\rightarrow$  table 3) assume that typical materials and processes are used to machine the bore by either honing or roller burnishing to achieve the specified diameter and finish.

### Recommendations for static seal surfaces

Static sealing surfaces must also have a proper surface finish to enable the desired sealing performance ( $\rightarrow$  fig. 3).

The counter-surfaces of static seals exposed to pressure, including the static side of dynamic rod and piston seals, should have a roughness  $R_a \leq 0,8 \mu\text{m}$  (30  $\mu\text{in.}$ ).

Seat diameters of guide rings and wiper seals, should have a roughness  $R_a \leq 1,6 \mu\text{m}$  (63  $\mu\text{in.}$ ). Axial faces of all grooves should have a roughness  $R_a \leq 3,2 \mu\text{m}$  (125  $\mu\text{in.}$ ).

Fig. 3

- Counter-surfaces of static seals exposed to pressure  
 $R_a \leq 0,8 \mu\text{m}$  (30  $\mu\text{in.}$ )
- Seat diameters of guide rings and wiper seals  
 $R_a \leq 1,6 \mu\text{m}$  (63  $\mu\text{in.}$ )
- Axial faces of all grooves  
 $R_a \leq 3,2 \mu\text{m}$  (125  $\mu\text{in.}$ )

## General technical information

### Materials

Materials play a major role in the performance and lifetime of seals. Generally, hydraulic seals are exposed to a variety of application and working conditions, such as a wide temperature range, contact with various hydraulic fluids and the outside environment as well as high pressure and contact forces. The appropriate seal materials have to be selected to achieve a reasonable service life and service intervals. A wide variety of seal materials from four major polymeric material groups is available:

- thermoplastic elastomers, such as polyurethane (TPU) and thermoplastic ether-ester block copolymers (TPC)
- rubbers, such as nitrile (NBR) and hydrogenated nitrile rubber (HNBR), fluorocarbon rubbers (FKM, FPM)
- polytetrafluorethylene (PTFE) and its compounds
- rigid thermoplastics and thermosets and their composites

To support sealing function and keep the contact force for long seal life, many different properties should be considered to provide effective seal materials. Examples include:

- good elasticity over a wide temperature range, especially at low temperatures
- excellent compression set and stress relaxation behaviour to keep the sealing force for the requested operating period
- reasonable hardness and flexibility to avoid leakage and allow easy installation
- superior gap extrusion resistance to cover the increased pressures of fluid power equipment
- adequate working temperature range
- good chemical compatibility to cover a wide assortment of hydraulic fluids such as mineral and synthetic oils, biodegradable and water-based fluids or fire-resistant fluids
- excellent tribological properties, i.e. low friction values and high wear resistance to achieve a high efficiency and avoid early failures especially when sealing against rough counter surfaces

In addition to these considerations, the structure and morphology of polymeric materials

make selection and specification of seal materials much more complicated than the standard materials used in mechanical engineering (e.g. aluminium or steel). Mechanical properties of polymeric materials are strongly influenced by time, temperature, load and rate of motion. Highly complex intermolecular processes affect the stress relaxation and retardation phenomena. Furthermore, the tribology of the system (e.g. friction and wear) has a strong influence on the seal material properties and vice versa. Therefore, state of the art sealing systems can only be developed by close cooperation between material experts and product designers, supported by advanced design tools like non-linear FEA and extensive seal testing capabilities.

SKF has a global material development organization that closely cooperates with the product development and testing functions. SKF is uniquely suited to develop, simulate, test and manufacture tailor-made materials for specific customer needs.

The following tables outline the most common materials used by SKF for serial production of hydraulic seals, including those materials used for products highlighted in this catalogue. A wide variety of additional seal materials are available for special hydraulic seals or other seal applications.

### Thermoplastic elastomers

SKF has a long history in developing and supplying special polyurethane grades for sealing purposes. SKF manufactures the well-known ECOPUR family of polyurethanes including H-ECOPUR for outstanding chemical and hydrolysis resistance, X-ECOPUR for extrusion resistance or S-ECOPUR for low friction and resistance to wear.

Polyurethanes combine the elastic properties of elastomers with the processability of thermoplastic materials. Seals made of polyurethanes provide excellent wear and pressure resistance and avoid leakage. Special sealing polyurethane grades have a superior compression set and relaxation performance as well as temperature stability compared to commodity industrial grades. Due to their elasticity and flexibility, they are easy to install.

**Table 4 (→ page 28)** lists common thermoplastic elastomers.

## Rubbers

Rubbers are widely used in the seals industry for rotary shaft seals, static sealing elements such as O-rings and energizers, as well as dynamic seals in the fluid power industry. Depending on the chemical composition, rubbers can cover a wide temperature range up to 200 °C (390 °F) and more and withstand a wide variety of hydraulic fluids. NBR elastomers in a hardness range from 70 to 90 Shore A are the most commonly used rubbers in the fluid power industry. For higher temperatures and more aggressive hydraulic fluids, SKF recommends HNBR or FKM elastomers.

**Table 5 (→ page 29)** lists common rubbers.

## PTFE

PTFE is a polymer with very unique properties. Due to its chemical composition, it is the plastic material with the highest chemical resistance and the lowest coefficient of friction, however, it has some restrictions in terms of mechanical properties and wear. Therefore, PTFE is very often modified by adding various inorganic and organic fillers to improve specific properties such as wear or extrusion resistance.

One of the most important characteristics of PTFE is the low coefficient of friction in combination with outstanding stick-slip performance. Therefore, PTFE is the preferred material in applications that require accurate positioning of hydraulic cylinders. Due to the increased modulus of elasticity compared to rubbers and polyurethanes, PTFE seals can usually not be installed by simple snap-in procedures and require special tools and procedures for installation.

**Table 6 (→ page 29)** lists common PTFE materials.

## Rigid thermoplastics and thermosets

Rigid thermoplastics and thermosets and their composites are characterized by much higher hardness and stiffness as well as reduced elasticity compared to polyurethanes, rubbers or PTFE. Therefore, they are used for components where mechanical strength is more important than flexibility, such as guide rings, anti-extrusion rings or special piston seal arrangements for heavy duty applications.

SKF offers rigid thermoplastics and composites in a wide variety of homogenous (un-

filled or “virgin”) grades (e.g. POM or PA), filled grades (e.g. glass-fibre reinforced PA) and fabric-reinforced composites (e.g. phenolic resin with cotton fabric, PF). For extreme conditions, SKF can provide high performance materials such as PEEK (polyetheretherketone).

**Table 7 (→ page 30)** lists common rigid thermoplastic and thermosets.

Table 4

Thermoplastic elastomers (TPU and TPC)

Material code	Material description	Hardness		Colour <sup>1)</sup>	Example uses
		Shore A	Shore D

## Hydraulic fluids

Fluids used in hydraulic systems serve multiple functions for the system performance:

- transfer power by flow under pressure acting on moveable surfaces
- lubricate surfaces in contact and relative motion – hydraulic cylinder components and seals, as well as other system components such as pumps and valves
- prevent corrosion of components
- cool the system, by carrying heat from areas of high load, motion or turbulence and spread it to the entire volume of the system including reservoir tanks and cooling equipment
- clean the system by carrying contaminants and wear particles to filter bodies or settling areas

The fluids used in hydraulic systems come in various chemical compositions and viscosity grades as suited to specific applications.

Viscosity is a measurement of the thickness of a fluid or the resistance to flow. Seal performance is affected by the viscosity of the fluid and changes to the viscosity during use. Most typical hydraulic fluids exhibit decreased viscosity with increasing temperature and increased viscosity with increasing pressure.

The most commonly used media in hydraulic systems are mineral oil based fluids with various additives. However, a variety of alternative fluids may be encountered in special applications. For example, biodegradable fluids such as synthetic (HEES) or natural esters (HETG) and polyalphaolefines (PAO) may be used to reduce environmental impact in the event of accidental spills. Flame retardant fluids based on water or synthetic esters may be safely used in confined spaces or where the hydraulic system is used in close proximity to ignition sources. The data, specifications and recommendations in this catalogue are for common mineral oil fluids. For guidance on specifications of sealing systems for alternative fluids, contact SKF.

The chemical composition of hydraulic fluids can impact the seal life and performance depending on compatibility with the seal material(s). Absorption and reaction of the seal material(s) with non-compatible fluids can cause, for example:

- changes in seal material volume – increased “swelling” or decreased “shrinking” and their respective impacts on seal contact force and friction
- hardening and embrittlement of the seal material
- softening, loss of strength or dissolving of the seal material
- degradation of the polymer chains or cross-linking, causing the material to fatigue or lose resilience
- discoloration of the seal material

Generally, these changes are accelerated by higher temperature. To avoid these changes and the resulting damage to seal function and life, careful consideration should be taken to ensure compatibility between the fluid and all seal materials, as well as the temperature and mechanical loads on the seal material. SKF has a long history and extensive database of test results concerning compatibility of various seal materials and fluids, as well as unparalleled expertise in developing materials to meet customers' needs for chemical resistance of seal materials.

**Table 8 (→ page 32)** summarizes the compatibility rating for the most important fluids and materials used in the fluid power industry. For materials not listed, contact SKF. **Table 8** provides general guidelines for new, clean fluids. Fluids vary by manufacturer, additives and contaminant levels. Materials vary by specific compound. The guidelines cannot substitute for testing the compatibility of a seal in the actual fluid and under actual operating conditions. Temperatures higher than specified in **table 8** can lead to degradation of the basic fluid or its additives. This can cause deterioration of the seal material. For applications where higher temperatures are required, contact SKF.

In addition to the specified hydraulic fluid, seal materials can be attacked by exposure to other fluids from other parts of systems (e.g. greases, fuels, coatings), environmental factors (e.g. humidity or radiation) and degradation and reaction with the fluids, additives and contaminants in the system producing additional chemicals.

## Gap extrusion

The process by which seal material is forced into the clearances between components is called gap extrusion. The dimension of this clearance gap is referred to as the extrusion gap, or “e-gap” (→ fig. 4).

The resistance of a given seal component to gap extrusion is mainly determined by the material composition and quality. Materials of greater hardness and stiffness typically also have improved resistance to extrusion. Therefore, anti-extrusion rings of materials harder than the seal material may be used to prevent seal extrusion into the e-gap (→ fig. 5).

Pressure is the main driver of extrusion, but the e-gap size and application temperature are also major factors. **Diagram 2** shows the pressure resistance of different materials as a function of temperature. The values were measured on an SKF test rig. The tests were carried out with a square ring seal, dimensions 38,7 x 49 x 5 mm under static pressure and an extrusion gap of 0,3 mm. The pressure values were taken at an extrusion length of 0,5 mm. While these sample values illustrate the differences in extrusion resistance for standard grades of typical seal materials, there are many variations of each basic composition that impact the extrusion resistance of seals. In addition, the profile design and the seal friction affect extrusion. For maximum allowable pressure, temperature and e-gap of each seal profile, refer to the profile data for each profile in the relevant chapters.

The maximum e-gap in a hydraulic cylinder is realized when the cylinder components are at the maximum radial misalignment of components. This misalignment is affected by:

- external forces acting upon the cylinder assembly (e.g. acceleration forces, frictional moments from rotation of cylinder end connections)
- the weight of the cylinder components (especially when mounted horizontally)
- deformation of cylinder components (rod flexing, guide ring radial deformation under force)
- the tolerance stack up of multiple cylinder components

Fig. 4

Fig. 5

Diagram 2

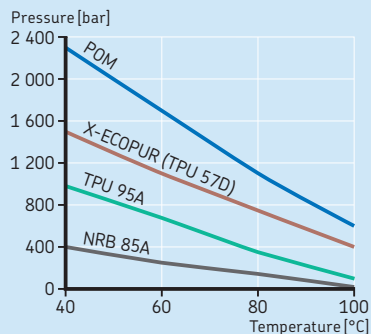

Fig. 6

Therefore, it is necessary to calculate the e-gap at the maximum misalignment at minimum material conditions of the cylinder and guide components.

For rod seals, the maximum e-gap should be calculated with the following conditions (→ **fig. 6**):

- guide ring groove at maximum diameter  $D$
- rod at minimum diameter  $d$
- guide ring cross section at minimum thickness  $CS$  (considering tolerances and any radial deformation of the guide ring under load)
- rod seal housing throat at maximum diameter  $t$

For piston seals, the maximum e-gap should be calculated with the following conditions (→ **fig. 7**):

- bore at maximum diameter  $D$
- guide ring groove at minimum diameter  $d$
- guide ring cross section at minimum thickness  $CS$  (considering tolerances and any radial deformation of the guide ring under load)
- piston seal housing at minimum outside diameter  $OD$

Fig. 7

The maximum allowable e-gap is provided in the profile data for each rod seal and piston seal profile in the relevant chapter. The e-gap can be kept within these limits by specifying and controlling the tolerances of dimensions described above and shown in **figs. 6** and **7**.

### Storage

During storage, the properties of elastomer products can be damaged either by chemical reactions or by physical processes. Chemical reactions are basically caused by the influence of heat, light, oxygen, ozone or contamination by chemicals. The physical processes, which are called physical ageing, are either due to the influence of external stresses leading to cracks and permanent deformation, or due to the migration of plasticizers, which makes the material more brittle and can lead to deformation of the parts.

Therefore, elastomer products only maintain their characteristics for several years without major changes, if they are properly stored. The ageing behaviour of elastomer products and their reaction on storage conditions depend considerably on their chemical structure. Unsaturated elastomers (e.g. nitrile rubber) age more quickly under improper storage conditions than saturated elastomers (e.g. fluororubber).

### Storage conditions

Elastomer products should be stored in accordance with the following recommendations, which are in line with the recommendations provided in ISO 2230 or DIN 7716.

- Rubber and plastic products should be stored in a cool and dry room. The relative humidity should be < 65%. Storage temperature should be around 15 °C (60 °F) and not exceed 25 °C (75 °F). If the storage temperature is below 15 °C, care should be taken during handling of stored products because they may have stiffened. They should be warmed up slowly at ambient temperature.
- The storage room must not contain any ozone-producing devices, such as electric motors or high-voltage devices.
- Rubber and plastic products should not be exposed to direct sunlight or artificial light with a high UV content (bulbs are preferred to neon lamps).
- Rubber products should not be exposed to drafts. They should be stored in airtight packaging. The package material must not contain plasticizers. Polyethylene is the most suitable package material.
- Contact between rubber products of different compositions should be avoided.
- Contact between rubber and plastic products and chemicals or dangerous metals (e.g. copper, manganese) should be avoided.
- Rubber and plastic products should be stored as tension-free as possible, i.e. the parts should not be subject to tension, pressure or bending. Rubber products, especially seals, must not be hung on nails or tightly folded or rolled for reasons of space.

## Shelf life

When stored under the conditions mentioned above, elastomer products retain their typical properties for several years (→ **table 9**).

The typical shelf life may be prolonged based on the actual product conditions at the end of the typical shelf life. Trained and experienced experts can approve a prolonged storage period based on a visual inspection of representative samples. The samples should not reveal any permanent distortion, mechanical damage or surface cracking. The material should not show any signs of hardening or softening nor any kind of tackiness.

Table 9

### Shelf life recommendations in years

Material	Typical shelf life	Possible prolongation
TPU, standard	5	2

PTFE	15	5
PA, POM, PF	8	4
PEEK	15	5
UHMWPE	10	5

## Installation and assembly

### Seal housings

The type of seal housing determines the method of installation, required equipment and the degree of difficulty. There are four main types of seal housings.

#### Closed grooves

Closed grooves are the most common seal housings (→ **fig. 8**). They require the most planning and effort to ensure that the seal is installed properly without damage. Not all seal cross section sizes and material combinations can be installed into this type of seal housing.

#### Open grooves

Open grooves allow the seal to be pressed in with minimal deformation and are therefore a good choice when the seal design, material or size prevent installation into a closed groove. Some seals, such as press-in wipers, have metal components that retain the seal in an open groove by friction (→ **fig. 9**). Other seals may require an additional retaining device (→ **fig. 10**). Plastic retaining rings, such as RI for rods or RR for piston, are available from SKF on request. Open grooves require specified edge radii or chamfers to prevent seal damage when the seal enters the groove or passes the retaining ring groove.

#### Split two-piece closed grooves

These grooves incorporate two separable machine components to provide an open groove when the seal is installed and a closed groove when the machine is fully assembled (→ **fig. 11**).

#### Stepped grooves

Stepped grooves allow seals to be installed with less deformation (→ **fig. 12**). Snap-in wipers are a common example in hydraulic cylinder applications.

#### Corner radii

The corner radii inside the groove should be sized to avoid inadvertent contact with the adjacent portion of the seal. Static side corner radius recommendations are provided in the product tables of the relevant chapter.

Fig. 8

Closed groove

Fig. 9

Open groove

Fig. 10

Open groove and retainer

### Groove edge radii

All outside groove edges and any other edges that may come into contact with the seal during installation or use should be broken with a small radius. Otherwise, the sharp edge may damage the seal. Unless otherwise specified, all outside groove edges should have a radius of approximately 0,2 mm (0.008 in.).

Fig. 11

#### Split two-piece closed groove

Fig. 12

#### Stepped groove

## General technical information

### Installation chamfers

Installation chamfers should be designed into the cylinder bore and on to the assembly end of the piston rod to ensure that the seal can easily transition from its free state diameter into its installed diameter. The installation chamfer should also be blended into the cylinder bore or piston rod diameter with a generous radius. The chamfer angle and minimum length recommendations are provided in the product tables of the relevant chapter.

### Installing rod seals

The method of installation and the possible groove types for rod seals depend on the materials, seal design and ratio between the diameter and cross-sectional height. **Table 10** provides general recommendations for profiles made of rubber or TPU with a hardness  $\leq 95$  shA. PTFE or other harder materials may require a smaller height  $S$  or even open grooves. The recommendations in **table 10** are not a substitute for careful installation trials in the particular application.

#### Installing rod seals in closed grooves

Rod seals can often be installed into closed grooves through carefully bending the profile similar to a kidney shape and then inserting it into the groove. It is very important to avoid sharp bending.

Thin and flexible profiles can be installed by hand ( $\rightarrow$  **figs. 13 a** and **b**). Mounting tools for TPU rod seals help to install profiles of greater section thickness ( $\rightarrow$  **figs. 14 a** to **f**). After installation, the seal may need to be calibrated to a round form using a cone-shaped calibration tool.

For PTFE seals, small diameter seals or for serial assembly, special assembly tools ( $\rightarrow$  **fig. 15, page 42**) may be required to save time or avoid seal damage. For additional information about such special installation tools, contact SKF.

Table 10

General recommendations for selecting the type of installation for rubber and TPU materials (hardness  $\leq 95$  shA)

Diameter/height ratio	Type of installation
$d/S \leq 6$	Open groove
$6 < d/S \leq 10$	Closed groove, installation with tool
$d/S > 10$	Closed groove, installation by hand

Fig. 13 a

Fig. 13 b

Fig. 15

## Installing piston seals

Piston seals installed in closed grooves must be expanded or stretched into position. Seals with step-cut slide rings such as CUT or SCP (→ *Piston seals with rigid split slide rings*, **page 54**) are relatively easy to expand into position. Continuous profiles should not be expanded to a material deformation of more than 20% for TPU or 30% for rubbers. Otherwise, the permanent deformation would be too large. Heating the seal, e.g. in an oil bath, decreases the required expansion force, but cannot increase the maximum material deformation.

Piston seals with a TPU slide ring can usually be installed by hand or with simple tools (→ **fig. 16**). PTFE seals or those with thicker radial sections may require special assembly tools to save time or avoid seal damage (→ **fig. 17**). For additional information about such special installation tools, contact SKF.

The recommendations cannot substitute for careful installation trials in the particular application.

Fig. 16

## Installing wiper seals

Snap-in wiper seals, which are installed in stepped grooves (→ **fig. 12, page 39**), are typically of a small radial section per diameter and close to the end of the cylinder head component. Therefore, installation by hand is usually possible.

Press-in wipers require special equipment and careful planning for ease of installation without damaging the wiper seal or housing. Assembly tools adapted for each press-in wiper size should be used in conjunction with appropriate steady force in a hand operated press. Installation by impact (e.g. striking the assembly tool with a hammer) is not advised. The press assembly tool should be configured to stop when the wiper seal has been pressed flush with the groove edge (→ **fig. 18**). Pressing beyond flush can damage the wiper seal.

#### Rod seals that can be used as piston seals

PTB 	These rod seal profiles are designed with similar inside and outside sealing geometry and, therefore, can also be used as piston seals (→ <i>Rod seals used as single-acting piston seals</i> , page 56).	→ <i>Rod and buffer seals</i> , page 111	138
STD 			164
DZ 			178

## Piston seals

### Basics

Piston seals (→ **fig. 1**) maintain sealing contact in sliding motion between the piston and the cylinder bore. Differential pressures acting on the piston to extend or retract the piston rod can be in excess of 400 bar (5 800 psi). The pressure acting on the piston seal increases contact forces between the piston seal and cylinder surface. Therefore, the surface properties of the sealing surfaces are critical to proper seal performance (→ *Counter-surface finish properties*, **page 22**).

Piston seals are typically classified into single-acting (pressure acting on one side only) and double-acting (pressure acting on both sides) seals.

#### Materials

Depending on the profile and the required characteristics of its components, a piston seal can consist of one or several materials. Common materials used for piston seals are thermoplastic polyurethane (TPU), polytetrafluoroethylene (PTFE), polyamide (PA), and nitrile rubber (NBR). The materials used for a specific profile are provided in the *Profile overview* (→ **page 46**) and in the relevant profile sections below.

For additional information, refer to *Materials* (→ **page 26**).

Storage . . . . .	36
Installation and assembly . . . . .	38

Fig. 1

Typical piston seal arrangement for double-acting cylinders

#### Gap extrusion

External forces acting on the piston rod, reacted by the fluid inside the cylinder, can result in abrupt pressure peaks. These peaks can be far in excess of the system operating pressure and may press a piston seal into the gap between the piston and bore, thereby causing damage to the seal and adversely affecting seal performance and cylinder operation. Seal materials must be carefully chosen to avoid gap extrusion (→ *Gap extrusion*, **page 34**). This risk of gap extrusion can also be minimized by using seals with anti-extrusion rings (→ *Piston seals incorporating anti-extrusion rings*, **page 53**).

#### Piston guidance

Guide rings avoid sliding metal-to-metal contact between the piston and cylinder bore and accommodate the radial loads of forces acting on the cylinder assembly. Although piston seals are designed to accommodate slight radial motion between the piston and bore, effective guide ring function to accurately centre the piston within the bore is important for piston seal performance. For additional information about piston guidance, refer to *Guide rings and guide strips* (→ **page 249**).

## Piston drift

When the piston rod is at rest and held in position by fluid, any amount of flow passing the piston can result in an unintended movement of the piston rod and cause drift. Although piston seal leakage is a possible source of drift, internal valve leakage, external system leakage and flow between the piston and rod static connections should also be carefully checked. In some applications, a minimal amount of flow passing the piston seal within specified limits is permitted. This tolerance allows the use of piston seals of low friction designs and materials or split slide rings for simple installation.

### Sealing between piston and rod

The piston can be welded to the rod (→ **fig. 2**) if the disassembly of the cylinder can be done by removing the rod end attachment. The piston can also be fixed to the rod end by a lock nut (→ **fig. 3**), which enables removing the piston from the rod during complete disassembly of the cylinder. When using a lock nut, static sealing (→ *O-rings and back-up rings*, **page 291**) is required between the piston and the rod end.

Fig. 2

Piston welded to the rod end tap

Fig. 3

Piston fixed to the rod by a lock nut and with a static seal and two back-up rings between piston and rod end

## Double-acting piston seals

Double-acting cylinders are the most widely used cylinder types. They operate with pressure on both sides and, therefore, require double-acting seal arrangements (→ **fig. 1**, **page 48**).

Double-acting piston seals have a symmetrical profile (cross section) and identical sealing functions in both directions. Typically, double-acting piston seals consists of a slide ring and an energizer. The deformation of the rubber energizer when installed provides adequate force to keep the slide ring in dynamic sealing contact with the cylinder bore, while sealing statically against the seal housing groove.

A double-acting cylinder typically has the same fluid on both sides of the piston. Therefore, a relatively thick lubrication film can be permitted between the piston seal and the cylinder bore to minimize friction and wear. The transportation of fluid occurring during dynamic operation is, however, small and insignificant in most applications.

SKF supplies double-acting piston seals in many different profiles and in a wide range of series and sizes, which make them appropriate for a wide variety of operating conditions and applications.

## Piston seals with polyurethane slide rings

Piston seals with thermoplastic polyurethane (TPU) slide rings have a nitrile rubber (NBR) energizer. The wear-resistant slide ring has a profiled dynamic sealing surface optimized to reduce friction and resist gap extrusion. Notches in the slide ring edges ensure rapid pressurization of the seal to react to abrupt changes in pressure. These profiles can usually be installed without special equipment and are resistant to damage during installation and cylinder assembly.

### MPV profiles

MPV profiles (→ **fig. 4**) have slide rings made of hard X-ECOPUR PS (TPU) developed for pressures up to 400 bar (5 800 psi). They are suitable for high fluid temperatures and in heavy duty applications, such as earthmoving equipment. MPV profiles are available in metric sizes and some fit seal housings in accordance with ISO 7425-1.

Fig. 4

Fig. 5

**DPV profiles**

DPV profiles (→ **fig. 5**) have slide rings made of hard X-ECOPUR PS (TPU) developed for pressures up to 400 bar (5 800 psi). They are suitable for high fluid temperatures and for heavy duty applications, such as earthmoving equipment. DPV profiles are available in inch sizes where wider, shallower seal housings are used.

**LPV profiles**

LPV profiles (→ **fig. 6**) have a polyether base polyurethane (EU) slide ring that provides resistance to hydrolysis (attack from moisture) and good low temperature flexibility. The O-ring energizer provides a cost-effective sealing solution. These profiles are developed for pressures up to 250 bar (3 625 psi) and suitable for light to medium duty applications, such as agriculture and material handling applications. They are available in metric sizes.

**CPV profiles**

CPV profiles (→ **fig. 7**) have a polyester base polyurethane (AU) slide ring. These profiles are developed for pressures up to 345 bar (5 000 psi) and suitable for light to medium duty applications. They are available in inch sizes where wider, shallow seal housings are used.

Fig. 6

Fig. 7

## Piston seals

### Piston seals with PTFE slide rings

PTFE slide rings may be preferred in applications with demands for low breakaway friction and when it comes to chemical and thermal resistance. Notches in the slide ring edges ensure rapid pressurization of the seal to react to abrupt changes in pressure. PTFE is hard and non-elastic when compared with polyurethane and rubber materials. Therefore, PTFE slide rings are combined with an energizer that provides the necessary sealing force and the static sealing function in the seal housing. For additional information about piston seal materials, refer to *Materials* (→ page 48).

#### GH profiles

GH profiles (→ fig. 8) have a nitrile rubber (NBR) energizer, which is an O-ring as standard. Square ring expanders are available on request. These profiles are suitable for pressures up to 400 bar (5 800 psi) and are available in metric and inch sizes. Some metric sizes fit seal housings in accordance with ISO 7425-1.

#### APR profiles

APR profiles (→ fig. 9) have a nitrile rubber (NBR) O-ring energizer. The PTFE slide ring incorporates a NBR X-ring to improve sealing performance. They are suitable for pressures up to 350 bar (5 075 psi) and are available in metric and inch sizes. Some metric sizes fit seal housings in accordance with ISO 7425-1.

Fig. 10

## Piston seals incorporating anti-extrusion rings

These SKF piston seals incorporate patented locking anti-extrusion rings (→ **fig. 10**) made of polyamide (PA). They are split for simple installation. Their snap-in design makes it easy to identify the correct mounting direction, holds them in place when mounted and prevents damage during assembly. For additional information about mounting and assembly, refer to *Installation and assembly* (→ **page 38**).

Piston seals incorporating anti-extrusion rings have an improved high pressure performance and minimize the risk of gap extrusion at abrupt pressure peaks (→ *Gap extrusion*, **page 48**).

### LCP profiles

LCP (→ **fig. 11**) profiles have a PTFE slide ring supported by harder PA anti-extrusion rings (→ **fig. 10**) and a nitrile rubber (NBR) energizer. These capped T-seals are suitable for pressures up to 690 bar (10 000 psi) and available in various industry common metric and inch sizes. Some metric sizes fit seal housings in accordance with ISO 5597.

### LTP profiles

LTP profiles (→ **fig. 12**) have a nitrile rubber (NBR) sealing ring supported by harder PA anti-extrusion rings on both sides. The sealing ring serves as a slide ring and also seals statically against the seal groove. These T-seals are suitable for pressures up to 345 bar (5 000 psi) and are available in inch sizes.

### Patented locking anti-extrusion rings

Fig. 11

LCP

Fig. 12

LTP

## Piston seals

### Piston seals with rigid split slide rings

These SKF piston seals have a rigid split slide ring made of glass fibre reinforced polyamide (GFR PA) and a nitrile rubber (NBR) energizer. The rigid slide ring has high resistance to wear and gap extrusion and provides low friction, even under high pressure. The split slide ring design facilitates the mounting process into a closed seal housing.

#### CUT profiles

CUT profiles (→ **fig. 13**) have a step cut slide ring and a rectangular energizer. They are suitable for pressures up to 500 bar (7 250 psi). They can be used for short pressure pulses up to 1 000 bar (14 500 psi) with proper system design. For additional information, contact SKF. These profiles are available in metric sizes and some fit seal housings in accordance with ISO 7425-1.

#### SCP

SCP profiles (→ **fig. 14**) have a step cut slide ring and an oval energizer. They are suitable for pressures up to 690 bar (10 000 psi). SCP profiles are available in inch sizes where wider, shallower seal housings are used.

Fig. 13

CUT

Fig. 14

SCP

Fig. 15

### Piston seals with integrated guide rings

These seals are designed as compact sets that incorporate the piston seal and guide rings into one assembly. Typically, they are applied in older cylinder designs. For designing new cylinders, SKF recommends using guide rings and piston seals in separate grooves (→ *Guide rings and guide strips*, page 249).

#### MD-L profiles

MD-L profiles (→ **fig. 15**) have a nitrile rubber (NBR) sealing ring with polyester thermoplastic elastomer (TPC) support rings on both sides, which incorporate the POM guide rings. The sealing ring serves as a slide ring and also seals statically against the seal groove. The support rings protect the sealing ring against gap extrusion. The guide and support rings are split for simple installation. MD-L profiles are suitable for pressures up to 250 bar (3 625 psi) and are available in metric sizes. Some sizes fit seal housings in accordance with ISO 6547.

## Single-acting piston seals

A single-acting piston seal is designed for cylinders where pressure is applied from one side only. The piston in single-acting cylinders may have oil on the pressure side only, while the opposite side is open to atmosphere. Therefore, the piston seal must leave a minimum of oil film when passing along the cylinder bore since the transportation of oil otherwise would result in a leakage to the exterior.

In single-acting cylinders, the open end may push air out and draw air in as the piston reciprocates. This air may carry moisture and contaminants into the cylinder, which can lead to seal damage. Vent filters may be fitted to the open side of the cylinder to reduce contaminants entering the inside of the cylinder. The cylinder bore may be hard chromium plated to prevent corrosion.

In addition, to prevent damage to the cylinder bore or piston seals, SKF can supply special piston wiper seals on request. For additional information, contact SKF.

### UNP profiles

UNP profiles (→ **fig. 16**) are single-acting U-cup seals made of thermoplastic polyurethane (TPU). They are suitable for pressures up to 350 bar (5 075 psi) and are available in metric and inch sizes. Appropriate full-face anti-extrusion rings for these profiles, for example BUS profile, are not covered in this catalogue, but are available on request. For additional information, contact SKF.

Fig. 16

UNP profile piston seal with a wiper seal

## Single-acting piston seals in double-acting cylinders

Two single-acting U-cup profile seals, facing in opposite directions, can be used in a double-acting cylinder. It is important to select seal designs which can relieve reverse pressure for such arrangements to prevent build-up of pressure between the two seals. UNP profiles are suitable for such double-acting arrangements because the dynamic seal lip can flex to relieve reverse pressure.

## Rod seals used as single-acting piston seals

Some rod seal profiles are designed with similar inside and outside sealing geometry and, therefore, can also be used as single-acting piston seals in single- or double-acting cylinders (→ **fig. 17**). PTB, STD and DZ rod seal profiles (→ *Rod and buffer seals*, **page 111**) can be used for those applications.

Rod seals with loaded-lip U-cup profiles may not relieve reverse pressure, but it is possible to remove their expand (X-ring) from one of the seals to allow reverse pressure relief (→ **fig. 17**).

Fig. 17

STD profiles used as piston seals (in a double-acting arrangement)

## APR profile data

<b>Materials</b>	Slide ring: PTFE 741 (PTFE 702 on request) X-ring and energizer: NBR A-8501 For additional information → <b>page 26</b>
<b>Pressure</b>	Up to 350 bar (5 075 psi)
<b>Speed</b>	Up to 1 m/s (3.2 ft/s)
<b>Temperature range</b>	<p>For temperature limits depending on fluid compatibility → <b>table 8, page 32</b></p> <ul style="list-style-type: none"> <li><span style="color: blue;">■</span> Extreme low temperature range: may be intermittently exposed (e.g. cold start-up) without seal damage, but seal performance may be compromised while in this range</li> <li><span style="color: gray;">■</span> Temperatures below the recommended operating range: seal performance depends on system design (precision guiding arrangement recommended)</li> <li><span style="color: green;">■</span> <b>Recommended operating temperature range for this profile and material</b></li> <li><span style="color: yellow;">■</span> Temperatures above the recommended operating range: acceptable only with reduced pressure, speed, and/or e-gap</li> <li><span style="color: red;">■</span> Extreme high temperature range: only occasional short term exposure (e.g. cylinder in curing oven of a powder coating process)</li> </ul>
<b>Dimension standards</b>	Some metric sizes fit seal housings in accordance with ISO 7425-1.
<b>Counter-surface</b>	→ <b>page 22</b>

Maximum values of application parameters (e.g. pressure, speed, temperature, e-gap) should not be applied continuously nor simultaneously.

## UNP profile data

<b>Materials</b>	Metric sizes → TPU U-1029 Inch size → TPU U-1023 For additional information → <b>page 26</b>
<b>Pressure</b>	Up to 350 bar (5 075 psi)
<b>Speed</b>	Pressure ≤ 250 bar (3 625 psi) → up to 1 m/s (3.2 ft/s) Pressure ≤ 350 bar (5 075 psi) → up to 0,5 m/s (1.6 ft/s)
<b>Temperature range</b>	<p>For temperature limits depending on fluid compatibility → <b>table 8, page 32</b></p> <ul style="list-style-type: none"> <li><span style="color: blue;">■</span> Extreme low temperature range: may be intermittently exposed (e.g. cold start-up) without seal damage, but seal performance may be compromised while in this range</li> <li><span style="color: grey;">■</span> Temperatures below the recommended operating range: seal performance depends on system design (precision guiding arrangement recommended)</li> <li><span style="color: green;">■</span> <b>Recommended operating temperature range for this profile and material</b></li> <li><span style="color: yellow;">■</span> Temperatures above the recommended operating range: acceptable only with reduced pressure, speed, e-gap and/or with the use of a full-face anti-extrusion ring</li> <li><span style="color: red;">■</span> Extreme high temperature range: only occasional short term exposure (e.g. cylinder in curing oven of a powder coating process)</li> </ul>
<b>Counter-surface</b>	→ <b>page 22</b>

Maximum values of application parameters (e.g. pressure, speed, temperature, e-gap) should not be applied continuously nor simultaneously.

## Piston seals

### More piston seals

The piston seals listed in this catalogue represent the preferred profiles in common sizes. SKF supplies many additional sizes and profiles. The following profiles are also manufactured in series production. For additional information about these profiles or if the application requires a solution outside of what is provided in this catalogue, contact SKF. SKF can provide customized sealing solutions for the toughest application conditions.

### PTFE slide ring piston seals

Piston seals with PTFE slide rings are available in a wide variety of profiles and materials (→ fig. 18). For additional information about material options, contact SKF.

### SPECTRASEAL

SPECTRASEAL is a PTFE seal that can be used as a single-acting piston seal (→ fig. 19). The metal spring energizer adds radial load to the seal lip contact areas. SPECTRASEAL is intended for extreme condition applications including high temperature or aggressive media. For additional information, contact SKF.

### Customized machined seal profiles

SKF can manufacture a broad variety of piston seal profiles with different materials and sizes with its industry-leading SKF SEAL JET production system (→ fig. 20). For additional information about customized machined profiles, refer to publication *Customized machined seals – Product range* or contact SKF.

<b>RSB</b> 	Buffer seal with PTFE slide ring, nitrile rubber energizer; patented and improved design to reduce pressure peaks acting on the rod seal and vent pressure back to system side; improved gap extrusion resistance at abrupt pressure peaks; suitable for heavy duty applications	<b>121</b>	<b>198</b> (inch)

# Basics

## Rod sealing systems

Rod and buffer seals maintain sealing contact in sliding motion between the cylinder head and the piston rod. Depending on the application, a rod sealing system can consist of a rod seal and a buffer seal (→ **fig. 1**) or a rod seal only (→ **fig. 2**). Rod sealing systems for heavy duty applications typically consist of a combination of both seal types, whereas the buffer seal is arranged between the rod seal and the piston in the cylinder head.

In addition to the sealing function, rod seals also provide a thin lubrication film on the piston rod that lubricates themselves and the wiper seals. The lubricant also inhibits corrosion of the piston rod surface. However, the lubrication film must be thin enough so that it returns to the cylinder during the return stroke.

Selecting profiles and materials for a rod sealing system is a complex task, considering all cylinder designs and application criteria. SKF supplies rod and buffer seals in many different profiles and in a wide range of materials, series and sizes, which make them appropriate for a wide variety of operating conditions and applications.

## Materials

Depending on the profile and the required characteristics of its components, rod and buffer seals can consist of one or several

Typical rod seal arrangement for heavy duty hydraulic applications

Fig. 2

Typical rod seal arrangement for light to medium duty hydraulic applications

materials. Common materials used for the sealing and energizing elements of rod and buffer seals are thermoplastic polyurethane (TPU), polytetrafluorethylene (PTFE) or nitrile rubber (NBR). Common materials used for rod seal anti-extrusion rings are polyamide (PA), polyacetal (POM) or PTFE. The materials used for a specific profile are provided in the *Profile overview* (→ **page 112**) and in the relevant profile sections below.

For additional information, refer to *Materials* (→ **page 26**).

Fig. 3

## Anti-extrusion rings

External forces acting on the rod can cause pressure peaks. They can be far in excess of the system operating pressure and may press a rod seal into the gap between the piston rod and the cylinder head. This risk of gap extrusion can be avoided for rod and buffer seals by using anti-extrusion rings. These hard and temperature-resistant rings can be integrated in the seal or a separate full-face anti-extrusion ring can be used. This ring can be added to a rod seal by simply extending the groove length (→ **fig. 3**). Integrated anti-extrusion rings fit into a notch in the rod or buffer seal and do not need a longer groove.

DZR (→ **fig. 10, page 119**) profile rod seals and RBB (→ **fig. 11, page 120**) profile buffer seals incorporate an anti-extrusion ring. Other U-cup and energized U-cup rod seals with an integrated anti-extrusion ring are available on request. Full-face anti-extrusion rings for rod and buffer seals, for example BUS profile, are not covered in this catalogue, but are available also on request. For additional information about anti-extrusion rings, contact SKF.

Integrated and full-face anti-extrusion rings

Integrated anti-extrusion ring

Full-face anti-extrusion ring

## Rod guidance

Guide rings avoid sliding contact between the piston rod and cylinder head surfaces and react the radial loads of forces acting on the cylinder assembly. Although rod sealing systems are designed to accommodate slight radial motion between the piston rod and head, effective guide ring function to accurately centre the rod within the head is important for rod seal performance. For additional information about rod guidance, refer to *Guide rings and guide strips* (→ **page 249**).

## Rod seals

Rod seals are typically single-acting seals, which means that fluid pressure acts from inside the cylinder on one seal side only. Pressures acting on the rod side of the piston can be in excess of 400 bar (5 800 psi), pressure peaks can be even higher. The pressure acting on the rod seal increases contact forces between the rod seal and cylinder surfaces. Therefore, rod seal materials should be wear resistant and the rod surface need to be manufactured to the recommended specifications (→ *Counter-surface finish properties*, page 22).

### Polyurethane U-cup rod seals

U-cup seals, as their name implies, have an U-shaped profile, including an outside static sealing lip and an inside dynamic sealing lip. The unique combination of resilience and its resistance to gap extrusion and wear makes thermoplastic polyurethane (TPU) the most common material used for U-cup seals in hydraulic application. When installed, the radial compression of the sealing lips provides adequate sealing force between the sealing lips and the cylinder components.

These U-cup seals are suitable for heavy duty applications. They are available with a single or double lip design, whereas the single lip design is preferred. However, depending on the application, system design, size and individual customer preferences, it may be preferable to use a U-cup with a secondary dynamic sealing lip.

### S1S profiles

S1S profiles (→ fig. 4) are made of ECOPUR (TPU) and have a single lip design. The geometry has been optimized using advanced FEM (Finite Element Modeling) and simulation techniques to provide the longest possible maintenance-free service. They are suitable for pressures up to 400 bar (5 800 psi) in heavy duty applications and are available in metric sizes.

### ZBR profiles

ZBR profiles (→ fig. 5) are made of LUBRITHANE (TPU) and have a double lip design. They are suitable for pressures up to 400 bar (5 800 psi) in heavy duty applications and are available in metric and inch sizes.

Fig. 4

S1S

Fig. 5

ZBR

## SIL profiles

SIL profiles (→ **fig. 6**) are made of ether-based TPU and have a double lip design. They provide good resistance to hydrolysis (attack from moisture) and good low temperature resilience. These profiles are suitable for pressures up to 350 bar (5 075 psi) for light to medium duty applications and are available in metric sizes.

## Energized U-cup rod seals

Energized U-cup rod seals incorporate a nitrile rubber (NBR) X-ring in their thermoplastic polyurethane (TPU) U-cup. The X-ring serves as energizer, provides additional sealing force and improves the long-term resilience of the sealing lips. This can be beneficial in applications with low operating pressure or low temperatures.

## PTB profiles

PTB profiles (→ **fig. 7**) are made of LUBRITHANE (TPU). Its type-B back-bevel sealing lip design with a chamfer on the leading edge regulates the fluid film on the piston rod surface. These profiles are suitable for pressures up to 400 bar (5 800 psi) and are available in metric and inch sizes. Some metric sizes fit seal housings in accordance with ISO 5597.

Fig. 6

SIL

Fig. 7

PTB

## Rod and buffer seals

### STD profiles

STD profiles (→ **fig. 8**) are made of LUBRITHANE (TPU). They are suitable for pressures up to 400 bar (5 800 psi) and can also be used as a heavy-duty static seal or a snap-in wiper seal. These profiles are available in inch sizes where narrower seal housings are used. Metric sizes are available on request.

### Hybrid rod seals

Hybrid rod seals incorporate dynamic sealing lips of different materials. These material combinations provide a hybrid with the functional benefit of each material and, therefore, a robust rod seal. An example is the sealing ability and resilience of nitrile rubber (NBR) combined with the extrusion and wear resistance of polyurethane (TPU).

### DZ profile

DZ profiles (→ **fig. 9**) combine a NBR primary sealing lip with a LUBRITHANE (TPU) secondary sealing lip into one seal. This combination provides a good low temperature resilience and is suitable for pressures up to 400 bar (5 800 psi). DZ profiles are available in metric and inch sizes. They are also available with an elastomer (FLUOROTREL/TPC) secondary sealing lip on request.

These hybrid rod seal profiles from SKF are the original of its kind and the first to be introduced into the market. DZ profiles are well established in the market.

Fig. 8

STD

Fig. 9

DZ

### DZR profile

DZR profiles (→ **fig. 10**) combine a NBR primary sealing lip, a LUBRITHANE (TPU) secondary sealing lip and a triangular polyamide (PA) anti-extrusion ring (→ *Anti-extrusion rings*, **page 115**) into one seal. These combinations provide good low temperature resilience, and improved resistance to deformation, wear, and gap extrusion. They are suitable for pressures up to 690 bar (*10 000 psi*) and for extreme heavy duty applications. DZR profiles are available in metric and inch sizes.

Fig. 10

DZR

### Buffer seals

Buffer seals protect the rod seals by reducing pressure peaks. Abrupt pressure peaks can occur by external forces acting on the piston rod, initiated by the fluid inside the cylinder. These pressure peaks can be far in excess of the system operating pressure. Buffer seals in combination with rod seals provide an effective rod sealing system for cylinders in heavy duty applications at high temperature and pressure.

#### Polyurethane U-cup buffer seals

##### RBB profile

RBB profiles (→ **fig. 11**) have a LUBRITHANE (polyurethane/TPU) sealing ring that incorporates a polyamide (PA) or polyacetal (POM) anti-extrusion ring. The flexible outside static sealing lip and channels in the front face ensure that pressure can return to the system side of the buffer and prevent build up of pressure between the rod and buffer seals. These profiles are suitable for pressure peaks and demanding workloads in heavy duty applications up to 690 bar (10 000 psi). They are available in metric and inch sizes.

#### Buffer seals incorporating slide rings

##### S9B profile

S9B profiles (→ **fig. 12**) have a nitrile rubber (NBR) O-ring energizer and a PTFE slide ring as standard. Depending on the application, SKF can manufacture the slide rings from a variety of PTFE materials. On request, SKF can supply these profiles also with X-ECOPUR polyurethane (TPU) slide rings for improved wear resistance and ease of installation compared to PTFE. S9B profiles with a PTFE slide ring are suitable for pressures up to 400 bar (5 800 psi), those with an X-ECOPUR slide ring up to 600 bar (8 700 psi). Both material combinations are available in metric and inch sizes.

Fig. 11

Fig. 12

### RSB profile

RSB profiles (→ **fig. 13**) have a nitrile rubber (NBR) energizer and a PTFE slide ring.

The resilient energizer has protrusions (→ **fig. 14**) on the system side, which are in contact with the buffer groove. This design keeps the slide ring in a permanent sealing position against the rod seal side of the buffer groove. Conventional buffer seal designs can shift axially within the groove and push fluid into the rod seal groove when subjected to abrupt pressure peaks. This ultimately causes rod seal failure. However, the patented design of RSB profiles prevents any axial shifting of the slide ring. Therefore, these profiles protect the rod seal in applications where conventional buffers are not sufficient. In combination with grooves in the energizer outside diameter and notches in the front face of the slide ring, the protrusions also ensure that pressure can return to the system side.

RSB profiles are suitable for pressures up to 400 bar (5 800 psi) in heavy duty applications and are available in inch sizes.

On request, for the most demanding applications of large equipment, SKF can manufacture these profiles with polyamide (PA) slide rings for additional extrusion and wear resistance.

## STD profile data

<b>Materials</b>	Sealing ring: TPU 95A, U-1003 X-ring: NBR 70A, A-8501 For additional information → <b>page 26</b>
<b>Pressure</b>	Up to 400 bar (5 800 psi)
<b>Speed</b>	Up to 1 m/s (3.2 ft/s)
<b>Temperature range</b>	<div style="display: flex; align-items: center;"> <div style="margin-right: 10px;"> <p>-50   -40   -30</p> <p>-60   -40   -20</p> </div> <div style="margin-left: 10px;"> <p>100   110   120 [°C]</p> <p>210   230   250 [°F]</p> </div> </div> <ul style="list-style-type: none"> <li><span style="display: inline-block; width: 15px; height: 15px; background-color: #0070C0; margin-right: 5px;"></span> Extreme low temperature range: may be intermittently exposed (e.g. cold start-up) without seal damage, but seal performance may be compromised while in this range</li> <li><span style="display: inline-block; width: 15px; height: 15px; background-color: #808080; margin-right: 5px;"></span> Temperatures below the recommended operating range: seal performance depends on system design (precision guiding arrangement recommended)</li> <li><span style="display: inline-block; width: 15px; height: 15px; background-color: #00B050; margin-right: 5px;"></span> <b>Recommended operating temperature range for this profile and material</b></li> <li><span style="display: inline-block; width: 15px; height: 15px; background-color: #FFD700; margin-right: 5px;"></span> Temperatures above the recommended operating range: acceptable only with reduced pressure, speed, e-gap and/or with the use of a full-face anti-extrusion ring</li> <li><span style="display: inline-block; width: 15px; height: 15px; background-color: #FF0000; margin-right: 5px;"></span> Extreme high temperature range: only occasional short term exposure (e.g. cylinder in curing oven of a powder coating process)</li> </ul>
<b>Counter-surface</b>	→ <b>page 22</b>

Maximum values of application parameters (e.g. pressure, speed, temperature, e-gap) should not be applied continuously nor simultaneously.

## DZ profile data

<b>Materials</b>	Primary sealing lip: LT NBR 70A, A-8504 Secondary sealing lip: TPU 95A, U-1003 For additional information → <b>page 26</b>
<b>Pressure</b>	Up to 400 bar (5 800 psi)
<b>Speed</b>	Up to 1 m/s (3.2 ft/s)
<b>Temperature range</b>	<div style="display: flex; align-items: center;"> <div style="margin-left: 10px;"> <p>-60 -50 100 110 120 [°C]</p> <p>-75 -60 210 230 250 [°F]</p> </div> </div> <ul style="list-style-type: none"> <li><span style="color: blue;">■</span> Extreme low temperature range: seal performance depends on system design (precision guiding arrangement recommended)</li> <li><span style="color: green;">■</span> <b>Recommended operating temperature range for this profile and material</b></li> <li><span style="color: yellow;">■</span> Temperatures above the recommended operating range: acceptable only with reduced pressure, speed, and/or e-gap</li> <li><span style="color: red;">■</span> Extreme high temperature range: only occasional short term exposure (e.g. cylinder in curing oven of a powder coating process)</li> </ul>
<b>Counter-surface</b>	→ <b>page 22</b>

Maximum values of application parameters (e.g. pressure, speed, temperature, e-gap) should not be applied continuously nor simultaneously.

## DZR profile data

<b>Materials</b>	<p>Primary sealing lip: LT NBR 70A, A-8504          Secondary sealing lip: TPU 95A, U-1003          Anti-extrusion ring: PA P-2506          For additional information → <b>page 26</b></p>
<b>Pressure</b>	Up to 690 bar ( <i>10 000 psi</i> )
<b>Speed</b>	Up to 1 m/s ( <i>3.2 ft/s</i> )
<b>Temperature range</b>	<p> <span style="color: blue;">■</span> Extreme low temperature range: seal performance depends on system design (precision guiding arrangement recommended)  <span style="color: green;">■</span> <b>Recommended operating temperature range for this profile and material</b>  <span style="color: yellow;">■</span> Temperatures above the recommended operating range: acceptable only with reduced pressure and/or speed  <span style="color: red;">■</span> Extreme high temperature range: only occasional short term exposure (e.g. cylinder in curing oven of a powder coating process)         </p>
<b>Counter-surface</b>	→ <b>page 22</b>

Maximum values of application parameters (e.g. pressure, speed, temperature, e-gap) should not be applied continuously nor simultaneously.

## RBB profile data

<b>Materials</b>	Sealing ring: TPU 93A, U-1023 Anti-extrusion ring: metric sizes → POM P-2518 inch sizes → PA P-2506 For additional information → <b>page 26</b>
<b>Pressure</b>	Up to 690 bar (10 000 psi)
<b>Speed</b>	Up to 1 m/s (3.2 ft/s)
<b>Temperature range</b>	<p> <span style="color: blue;">■</span> Extreme low temperature range: may be intermittently exposed (e.g. cold start-up) without seal damage, but seal performance may be compromised while in this range  <span style="color: grey;">■</span> Temperatures below the recommended operating range: seal performance depends on system design (precision guiding arrangement recommended)  <span style="color: green;">■</span> <b>Recommended operating temperature range for this profile and material</b>  <span style="color: yellow;">■</span> Temperatures above the recommended operating range: acceptable only with reduced pressure and/or speed  <span style="color: red;">■</span> Extreme high temperature range: only occasional short term exposure (e.g. cylinder in curing oven of a powder coating process)         </p>
<b>Dimension standards</b>	Some metric sizes fit seal housings in accordance with ISO 7425-2.
<b>Counter-surface</b>	→ <b>page 22</b>

Maximum values of application parameters (e.g. pressure, speed, temperature, e-gap) should not be applied continuously nor simultaneously.

## S9B profile data

<b>Materials</b>	O-ring energizer: NBR A-8501 Slide ring: PTFE 741 or X-ECOPUR For additional information → <a href="#">page 26</a>
<b>Pressure</b>	X-ECOPUR slide ring → up to 600 bar (8 700 psi) PTFE 741 slide ring → up to 400 bar (5 800 psi)
<b>Speed</b>	Up to 2 m/s (6.5 ft/s)
<b>Temperature range</b>	<p>With PTFE 741 slide ring:</p>  <p>With X-ECOPUR slide ring:</p>  <ul style="list-style-type: none"> <li> Extreme low temperature range: may be intermittently exposed (e.g. cold start-up) without seal damage, but seal performance may be compromised while in this range</li> <li> Temperatures below the recommended operating range: seal performance depends on system design (precision guiding arrangement recommended)</li> <li> <b>Recommended operating temperature range for this profile and these materials</b></li> <li> Temperatures above the recommended operating range: acceptable only with reduced pressure, speed, and/or e-gap</li> <li> Extreme high temperature range: only occasional short term exposure (e.g. cylinder in curing oven of a powder coating process)</li> </ul>
<b>Counter-surface</b>	→ <a href="#">page 22</a>

Maximum values of application parameters (e.g. pressure, speed, temperature, e-gap) should not be applied continuously nor simultaneously.

## Rod and buffer seals

### More rod and buffer seals

The rod and buffer seals listed in this catalogue represent the preferred profiles in common sizes. SKF supplies many additional sizes and profiles and provides customized solutions for the toughest application conditions. The following profiles are also manufactured in series production. For additional information about these profiles or if the application requires a solution not provided in this catalogue, contact SKF.

#### Rod locking T-seals

LTR profiles (→ **fig. 15**) are T-seals for rod applications with a rubber sealing ring supported by patented locking anti-extrusion rings on both sides. Therefore, they can be used as double-acting rod seals for special applications. For example, in tandem cylinders that require a rod seal to take pressure from both sides. For additional information about materials and sizes, contact SKF.

#### TEFLATHANE seals

These rod seals of various designs and material combinations incorporate an anti-extrusion ring that is bonded into the body. They are suitable for high temperature and/or short-stroke applications. For example, U-cup seals made of special high temperature polyurethane bonded to a PTFE anti-extrusion ring in rock hammer applications (→ **fig. 16**). For additional information about materials and sizes, contact SKF.

#### Chevron sets

These moulded or machined chevron sets (→ **fig. 17**) are available in a wide variety of materials and designs. They are also called "vee packings" and typically consist of a header ring, one or several chevron rings, and a base ring. These rings can be made of different materials to achieve their own specific functional benefits. For additional information about designs, materials and sizes, contact SKF.

## SPECTRASEAL

SPECTRASEAL is a PTFE seal that can be used as a single-acting rod seal (→ **fig. 18**). The metal spring energizer adds radial load to the seal lip contact areas. SPECTRASEAL is intended for extreme condition applications including high temperature or aggressive media. For additional information, contact SKF.

Fig. 18

SPECTRASEAL

## Rod and buffer seals

### Customized machined seal profiles

SKF can manufacture a wide variety of rod seal profiles with different materials and sizes with its industry-leading SKF SEAL JET production system (→ **fig. 19**). For additional information about customized machined profiles, refer to publication *Customized machined seals – Product range* or contact SKF.

## Basics

Hydraulic cylinders operate in a variety of applications and environmental conditions, including exposure to dust, debris or outside weather conditions. To prevent these contaminants from entering the cylinder assembly and hydraulic system, wiper seals (also known as scrapers, excluders or dust seals) are fitted on the external side of the cylinder head (→ fig. 1).

Wiper seals maintain sealing contact to the piston rod when the equipment is stationary (static, no reciprocating motion of rod) and in use (dynamic, reciprocating rod). Without a wiper seal, the retracting piston rod could transport contaminants into the cylinder.

The outside static sealing of the wiper within the groove is also important to avoid moisture or particles from entering around the outside of the wiper seal.

### Installation

Housings for wiper seals are typically designed either with open or stepped housing grooves (→ fig. 2).

Wipers for open grooves are encased in a steel sleeve and pressed into the groove. Therefore, they are called press-in wipers.

Wipers for stepped grooves do not have metal components and can usually be deformed by hand for installation. They “snap” into the groove and, therefore, are called snap-in wipers.

For additional information about installation, refer to *Installing wiper seals* (→ page 43).

## Press-in wiper seals

Press-in wiper seals provide a robust static sealing on the outside surface by the steel sleeve that is pressed into the cylinder head. The polyurethane (TPU) wiper lip is bonded to the drawn sheet steel sleeve and maintains a sealing force by tension as well as cantilever action (flexing) to the seal lips. This ensures robust preload of the wiper lips even under minor radial misalignments between the rod and head. Press-in wiper seals are available with a single-lip or double-lip design.

### PA profiles

PA profiles (→ **fig. 3**) have an aggressive single wiping lip that protrudes from the head. This design allows small radial cross sections and reduces the risk of contaminant adherence on the wiper lip. PA profiles are suitable for heavy duty off-highway applications and are available in metric sizes.

### Materials

Polyurethane (TPU) is the most common material for wiper seals in modern hydraulic seal applications. SKF wiper seals made of TPU are developed for wear resistance and flexibility as well as with the right physical properties to aggressively remove contaminants. SKF can supply wipers in a wide variety of materials, including rubber elastomers and PTFE (→ *More wiper seals*, **page 246**).

For additional information, refer to *Materials* (→ **page 26**).

Fig. 3

PA

## Wiper seals

### MCW profiles

MCW profiles (→ **fig. 4**) have an aggressive single wiping lip that does not protrude from the head. This allows compact arrangement when the cylinder is retracted. These profiles are available in metric and inch sizes.

### PAD and PADV profiles

PAD profiles (→ **fig. 5**) have a double-lip design with an internal-facing wiper lip that regulates the lubrication film on the rod. The internal lip wipes excess fluid film from the rod on extending stroke and allows this excess fluid to return under the rod seal on the retracting stroke. Double-acting wipers, therefore, improve the performance and extend the service life of rod sealing systems.

However, excess system pressure acting on the internal-facing lip, such as fluid passing a damaged rod seal, could overcome the press force between the groove and the steel sleeve and push the wiper out of the groove. Therefore, SKF recommends using double-acting wipers in combination with U-cup rod seals with a single-lip design, such as S1S profile (→ *Rod seals*, **page 116**), to ensure pressurised fluid can return to the hydraulic system. Retaining hardware, such as a snap ring, may also be required to retain the wiper in the groove in case of minor pressure build up (→ **fig. 6**).

PAD profiles (→ **fig. 7**) are also available with a vent in the internal lip (designation PADV). They do not need extra retaining hardware in most applications. The vent prevents pressure build up on the internal-facing lip. PAD and PADV profiles are available in the same metric sizes.

Fig. 6

PAD with snap ring

Fig. 7

PADV

Fig. 8

## Snap in wiper loose in the groove

## Snap-in wiper seals

Snap-in wiper seals are easy to install without any special equipment. They do not have metal components and are typically less expensive than press-in wipers.

A common problem with snap-in wipers is that they become loose in the groove resulting in poor static sealing on the outside surface and reduced preload on the dynamic wiper lip (→ **fig. 8**). Furthermore, if the inside edge of the wiper could contact the rod, it may become an unintended sealing lip (→ **fig. 8**) and could trap pressure between the rod seal and wiper. Therefore, SKF snap-in wipers have special sealing and venting features to help ensure proper operation.

## Wiper seals

### DTW profiles

DTW profiles (→ **fig. 9**) have a single-lip design and radial static seal lip on the outside surface that maintains a positive sealing contact. An axial static seal lip on the external side face keeps the wiper tight in the groove and also serves as an additional static seal. Vents on the inside edge prevent the wiper trapping pressure or being pushed out by pressure in the event the rod seal has become damaged or has exceeded its service life. These profiles are available in metric and inch sizes.

### DX profiles

DX wipers (→ **fig. 10**) have a patented profile with a single external lip design and vented inside edge. These profiles incorporate a rubber O-ring that maintains a robust static sealing contact in the groove. The O-ring also serves as an energizer and provides robust and long term preload on the dynamic wiper lip. In case of radial misalignment, the entire TPU wiper ring follows these radial movements (“floating” design) as the relatively soft and flexible rubber O-ring energizer deforms to compensate.

When the wiper lip encounters resistance from contaminants adhered to the retracting rod (e.g. tree sap or frozen rain), the profile reacts by twisting to increase the preload on the dynamic wiper lip.

Therefore, DX profiles include the functionality of press-in wipers as well as the convenience of snap-in wipers. These profiles are available in inch sizes.

Fig. 11

## HW profiles

HW profiles (→ **fig. 11**) have a double-lip design with an internal-facing wiper lip that regulates the lubrication film on the rod. The internal lip wipes any excess fluid film from the rod on the extending stroke and allow this excess fluid to return under the rod seal on the retracting stroke. Double-acting wipers, therefore, improve the performance and extend the service life of rod sealing systems. SKF recommends using double-acting wipers in combination with U-cup rod seals with a single-lip design, such as S1S profile (→ *Rod seals*, **page 116**), to ensure pressurised fluid can return to the hydraulic system.

### PA profile data

<b>Material</b>	TPU W93 For additional information → <b>page 26</b>
<b>Speed</b>	Up to 1 m/s (3.2 ft/s)
<b>Temperature range</b>	-40 to +110 °C (-40 to +230 °F)
<b>Dimension standards</b>	Some sizes fit seal housings in accordance with ISO 6195-B.
<b>Counter-surface</b>	→ <b>page 22</b>

Maximum values of application parameters (e.g. speed, temperature) should not be applied continuously nor simultaneously.

## Wiper seals

### More wiper seals

#### Wiper seals made of PTFE

SKF wiper seals made of PTFE (→ **fig. 12**) are intended for applications where there is a demand for low breakaway friction or chemical resistance. SKF machines PTFE wipers from stock. Therefore, SKF can supply PTFE wipers in a wide variety of profiles and different sizes at short notice.

For additional information about PTFE wiper seals, contact SKF.

#### Rod seals used as wiper seals

STD rod seal profiles (→ *STD profiles*, **page 118**) are designed with similar inside and outside sealing geometry and, therefore, can also be used as aggressive snap-in wiper seals (→ **fig. 13**).

For additional information about rod seals used as wiper seals, contact SKF.

#### Customized machined seal profiles

SKF can manufacture a wide variety of wiper seal profiles (→ **fig. 14**) with different materials and customized sizes with its industry-leading SKF SEAL JET production system. SKF can supply these tailor-made machined wiper seals in close partnership with customers from the design phase to serial production.

For additional information about customized machined profiles, refer to publication *Customized machined seals – Product range* or contact SKF.

## Basics

Guide rings and guide strips accommodate radial loads of forces acting on the cylinder assembly and guide the rod in the cylinder head as well as the piston in the cylinder bore (→ **fig. 1**).

Guides are made of polymer materials and, therefore, avoid metal-to-metal contact between moving parts in a working hydraulic cylinder. Compared to metal guides, polymer guides provide the following advantages in hydraulic cylinders:

- significantly longer service life
- work more smoothly against the cylinder tube and the sealing surfaces
- avoid wear of cylinder surfaces despite the presence of contamination particles
- high resistance to insufficient lubrication at low speeds
- larger contact area (→ **fig. 2, page 251** and **fig. 4, page 252**) due to higher degree of elastic deformation distributes the load and reduces stress to counter-surface
- certain self-lubricating ability

SKF supplies different precision machined guide rings with different polymer materials and sizes, which make them appropriate for a wide variety of operating conditions and applications.

Guide strips and guide rings of PTFE are also available for applications where static friction must be minimized. PTFE guides have limited load carrying capability and should only be used in applications with light loads.

Storage . . . . .	36

Fig. 1

## Concentric alignment of cylinder components

Significantly, cylinders and all their components are designed to minimize radial movements at load or pressure changes. It is also important that the piston and rod remain in a concentric position during the entire stroke to maintain seal effectiveness, especially at low temperatures, and to minimize the buckling loads on the piston rod. This in turn depends on the combined tolerances of the cylinder bore, the rod, the radial thickness of the guide rings or strips, and the housing diameters.

## Guide distance

The bending moment on the cylinder components and the load on guide rings at any point in the cylinder stroke are a function of the radial loads and the distance between the rod and piston guides. Therefore, the distance between guide rings should be considered when designing the cylinder and calculating the guide ring loads.

## Guide lubrication

The guide must receive ample lubrication at all times. Rod guide rings are typically placed inward of both the rod and buffer seal and should be lubricated on assembly with the same oil as the system media. SKF recommends not to place guide rings outside the rod seal. However, in certain conditions, PTFE guides or strips may be used outside the rod seal due to their self-lubricating properties.

Fig. 2

Metal guide

Polymer guide

## Guide rings and guide strips

### Load distribution and guide width

With metal guides, the machining tolerance would cause a diameter mismatch, resulting in a narrow contact area and high stress contact ( $\rightarrow$  fig. 3), which could cause damage or wear to the guiding surfaces.

The higher degree of elastic deformation of polymer materials provides larger contact surfaces and a better utilization of the guide width ( $\rightarrow$  fig. 4). While the guide ring load is realistically not an even distribution, the guide

ring load and width requirements of precision tolerance guide rings are estimated with the projected area of the full dynamic surface (inside diameter for rod guides or outside diameter for piston guides) assuming the load is carried evenly across the surface ( $\rightarrow$  fig. 5).

SKF recommends using a safety factor of at least  $f \geq 2$  to double the radial load when calculating the required guide width ( $\rightarrow$  *Guide ring width*, page 259). The effective load carrying width of the guide ring is approx. 2 mm (0.08 in.) smaller than the housing groove width because of the manufacturing and installation tolerances and the reduction of the guide ring width by the chamfers and radii. Dynamic forces, accelerating forces, vibrations and angular forces should be considered when calculating the transverse forces from the rod ends of the cylinders.

For additional information, contact SKF.

Load distribution with polymer guides

Fig.5

Theoretical load distribution

## Materials

The demands on reliability are continuously increasing. At the same time, the service conditions are getting tougher to match the development towards higher effectiveness of the hydraulic systems. Therefore, it is very important to be familiar with the operating conditions and parameters, such as operating temperature and pressure, load, speed, and fluid when choosing the most appropriate guide material. The most common materials for guides listed in this catalogue are:

- glass fibre reinforced polyamide
- phenolic/fabric composite
- PTFE

### Polyamide

Glass fibre reinforced polyamide guides are suitable for medium and heavy duty applications and are characterized by the following properties:

- wide temperature range
- wear resistant
- reduce vibrations
- protect seals from particles
- protect components from diesel effect
- easy to install
- tight tolerances
- withstand heavy side loads
- withstand high cycling speed
- prone to moisture swell before installation

GFR PA P-2501 is the standard polyamide material for guide rings. Technical specifications are provided in **table 1** (→ **page 254**). For additional information, refer to *Materials* (→ **page 26**).

### Phenolic/fabric composite

Phenolic/fabric composite consists of cotton fabric bound with thermoset phenolic resin. Its structure and the ability of the fabric fibres to absorb a certain amount of oil make phenolic guides almost self-lubricating. However, phenolic guides should not be used at high stroke speeds over 0,5 m/s (1.6 ft/s). Phenolic guides are suitable for medium and heavy duty appli-

cations and are characterized by the following properties:

- wide temperature range
- wear resistant
- reduce vibrations
- protect seals from particles
- protect components from diesel effect
- low thermal expansion
- easy to install
- tight tolerances
- withstand heavy side loads

Technical specifications are provided in **table 1** (→ **page 254**). SKF also supplies a variety of other thermosetting resins and fabrics on request.

For additional information, refer to *Materials* (→ **page 26**).

### PTFE

PTFE is typically used in guides where low friction and resistance to chemical, heat or wear are essential. However, PTFE should only be used in applications with low surface pressure. To obtain optimal wear resistance, PTFE materials are available with different fillers, such as bronze or carbon powder. PTFE guides are characterized by the following properties:

- chemical resistance
- wide temperature range
- low friction
- anti-adhesive, low breakaway friction
- good wear resistance
- reduce vibrations
- protect seals from particles
- protect components from diesel effect
- tight tolerance machined guide rings available

PTFE MS-292 is the standard PTFE material for guides and strips. Technical specifications are provided in **table 1** (→ **page 254**). SKF also can supply many other PTFE material compounds on request.

For additional information, refer to *Materials* (→ **page 26**).

Table 1

### Guide ring material comparison

Material	Ultimate compressive strength	Maximum recommended speed <sup>1)</sup>	Maximum recommended application temperature <sup>1)</sup>	Maximum recommended bearing load pressure <sup>1)</sup> at 20 °C (70 °F)	Maximum recommended bearing load pressure <sup>1)</sup> at 80 °C (175 °F)
–	N/mm <sup>2</sup> (psi)	m/s (ft/s)	°C (°F)	N/mm <sup>2</sup> (psi)	N/mm <sup>2</sup> (psi)
<b>Polyamide P-2551</b>	158 (22 915)	1 (3.3)	120 (250)	40 (5 800)	30 (4 350)
<b>Phenolic PF</b>	240 (34 805)	0,5 (1.6)	120 (250)	50 (7 250)	30 (4 350)
<b>PTFE MS-292</b>	<sup>2)</sup> (depending on time and temperature)	5 (16.4) (depending on seal system)	200 (390)	15 (2 175)	7,5 (1 085)

<sup>1)</sup> Maximum values are for intermittent exposure and should not be applied simultaneously.

<sup>2)</sup> PTFE is subject to creep under compression and, therefore, compressive strength depends on time and temperature.

## Guide rings

SKF guide rings are precision machined according to tight tolerance specifications on the radial section of the guide. Therefore, they optimize guide load distribution and limit radial misalignment of components for best seal performance. SKF supplies the following guide rings:

- WAT rod or piston guide rings
- RGR rod guide rings
- PGR piston guide rings

All of these precision guide rings are split with an angle cut as standard (→ **fig. 8, page 257**). Other types and designs or angles of cut are available on request.

### WAT rod or piston guide rings

These standard guide rings can be used in piston or rod applications, means either dynamic on the outside or inside surfaces. WAT guide rings are made of glass fibre reinforced polyamide (GFR PA P-2501) as standard. On request, SKF can supply WAT guide rings in a variety of materials, including self-lubricated rings with PTFE (P-2551).

### RGR rod guide rings

RGR guide rings are developed for guiding rods with dynamic inside surfaces. They are made of phenolic/fabric composite (PF) as standard. On request, SKF can supply RGR guide rings in a variety of materials.

They are manufactured and packaged to promote an open split before mounting and, therefore, clamp in the inside groove of the cylinder head. This makes it easier to assemble the cylinder later.

### PGR piston guide rings

PGR guide rings are developed for guiding pistons with dynamic outside surface. They are made of phenolic/fabric composite (PF) as standard. On request, SKF can supply RGR guide rings in a variety of materials.

They are manufactured and packaged to promote a narrow split or even closed ring before mounting and, therefore, be tight in the external groove in the piston. This makes it easier to assemble the cylinder later.

## Guide rings and guide strips

### Guide strips

SKF guide strips are made of PTFE and should only be used in light duty applications or when fluid, temperature, friction, or speed do not allow any other material. They are typically used with PTFE sealing systems (→ **fig. 6**). At system operating pressures over 200 bar (2 900 psi), contact SKF.

PTFE guide strips are available with different designs (→ **fig. 7**) and can be cut with different configurations (→ **fig. 8**).

### Guide strips cut to length

Based on the hardware dimensions, SKF can supply guide strips with specified lengths. They are designated according to a system that states the type and design, dynamic diameter, groove diameter, groove width, type of cut and material (→ **table 2**).

For additional information and order assistance, contact SKF.

Table 2

Designation system for guide strips with individual length

**SB 200×195×12×45-292**

## Guide rings and guide strips

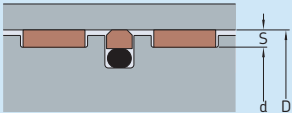

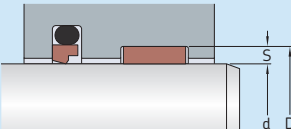

### Guide strips uncut

SKF can also supply uncut guide strips. They are designated by the type and design, thickness and groove width in millimetres, material code, and length in metres, such as SB 2x8,1-292 / 25 m.

For additional information and order assistance, contact SKF.

### Calculating the guide strip length

The individual guide strip length CL can be calculated using the formulas provided in **table 3**.

Table 3		
Guide strip length CL		
Material	Guide strip for piston applications	Guide strip for rod applications
		
PTFE, material code MS-292	$CL = 3,11 (D - S) - 0,8$	$CL = 3,11 (d + S) - 0,8$
PTFE, material codes MS-302, MS-304	$CL = 3,116 (D - S) - 0,8$	$CL = 3,116 (d + S) - 0,8$
	CL = guide strip length [mm] D = cylinder bore diameter [mm] d = rod diameter [mm] S = strip thickness [mm]	

## Guide ring width

The requisite minimum guide ring width can be calculated for:

- piston guide ring width using

$$L = \frac{F f}{p D} + 2$$

- rod guide ring width using

$$L = \frac{F f}{p d} + 2$$

where

L = requisite minimum guide ring housing width [mm]

D = cylinder bore diameter [mm]

d = rod diameter [mm]

F = radial load [N]

f = safety factor (recommended minimum 2 for calculations using max. load pressure p)

p = maximum recommended bearing load pressure [N/mm<sup>2</sup>] (→ **table 1, page 254**)

### Example

A phenolic/fabric composite piston guide ring (type PGR .. PF), 3 mm thick, is required for a piston diameter D = 100 mm. The load F = 20 000 N and the safety factor f = 2. What is the required guide ring width L at an operating temperature of 80 °C?

From **table 1** (→ **page 254**), the maximum recommended bearing load pressure p = 30 N/mm<sup>2</sup>. The required guide ring width L is

$$L = \frac{20\,000 \times 2}{30 \times 100} + 2 = 15,3 \text{ mm}$$

The required guide ring width L is 15,3 mm, however, choose a guide ring with L = 20 mm, which is the nearest larger guide ring width, such as PGR 100x94x20-PF (→ **product table, page 285**).

5.1

## 5.2 WAT rod or piston guide rings, inch sizes

D 1 – 2.5 in.

Rod application  
(dynamic on the inside surface)

Piston application  
(dynamic on the outside surface)

$h \geq S/2$

## 5.2 WAT rod or piston guide rings, inch sizes

D 4 – 5.25 in.

Rod application  
(dynamic on the inside surface)

Piston application  
(dynamic on the outside surface)

$h \geq S/2$

## 5.2 WAT rod or piston guide rings, inch sizes

D 5.25 – 6.75 in.

Rod application  
(dynamic on the inside surface)

Piston application  
(dynamic on the outside surface)

$h \geq S/2$

## More guide rings

### Spark rings

Spark rings (also known as contamination rings, → **fig. 9**) are not technically guide rings, as they are not intended to accommodate radial loads. They rather protect the guides and piston seals from damage due to contamination particles or combustion of gases in the fluid media (diesel effect). SKF supplies spark rings in a variety of PTFE materials.

### Customized machined guide profiles

SKF can manufacture a wide variety of guide profiles (→ **fig. 10**) with different materials and customized sizes with its industry-leading SKF SEAL JET production system. SKF can supply tailor-made machined guide rings in close partnership with customers from the design phase to serial production.

For additional information about customized machined profiles, contact SKF.

## Basics

O-rings are one of the most common sealing solutions. SKF supplies O-rings in a wide range of sizes and different materials, which make them appropriate for a wide variety of operating conditions and applications. They are easy to install and they enable a simple and economic seal housing design.

O-rings maintain sealing contact force by radial or axial deformation in the seal housing between two machine components. The most important criteria that influence the maximum operating pressure at which O-rings in static radial sealing can be used are the following:

- extrusion gap (→ **fig. 2, page 298**)
- material (→ *Materials*)
- sealed fluid
- temperature

Under specific conditions, there is a risk for gap extrusion (→ *Extrusion gaps and back-up rings, page 298*). Back-up rings prevent O-rings from gap extrusion in static radial sealing.

O-rings are used in a wide variety of applications sealing various media. This catalogue focuses on sealing systems for hydraulic cylinders. Therefore, this chapter and provided recommendations apply to static sealing common mineral-based hydraulic fluids (→ *Hydraulic fluids, page 31*).

## Designations

For consistency, the designations of SKF O-rings (→ **table 1**) and back-up rings (→ **table 2**) consist of their dimensions in metric units. However, the product tables for both rings are provided in inch and metric sizes. If applicable, the unique dash-numbers for O-ring sizes in accordance with standards AS 586 and ISO 3601 are also listed.

## Materials

The O-rings listed in this catalogue are made of nitrile rubber (NBR) with 70 Shore A (shA) hardness as standard. This is the most common O-ring material and hardness used in hydraulic cylinder applications. On request, SKF can supply alternative hardnesses such as 80 shA or 90 shA. However, SKF generally recommends choosing O-rings with 70 shA and combining them with one or two back-up rings (→ *Extrusion gaps and back-up rings, page 298*). At operating temperatures above 100 °C (210 °F), fluorocarbon rubber or HNBR rubber can be an appropriate material, depending on the fluid.

SKF back-up rings listed in this catalogue are made of polyurethane (TPU). On request, SKF can supply alternative materials and hardness. Common back-up ring materials are listed in the designation system (→ **table 2**).

For additional information about O-ring and back-up ring materials, refer to *Materials* (→ **page 26**).

## O-rings and back-up rings

# Standards and sizes

### Dimension standards

SKF can supply O-rings in a wide variety of sizes in accordance with various O ring standards. **Table 3** provides the most common national and international O-ring standards and their relevant sizes.

### Inside/cross section diameter proportion

O-rings used in more demanding applications, such as higher operating pressures or larger misalignments, may require larger cross section diameters. SKF recommends proportions

between inside diameter ID and cross section diameter CS as provided in **diagram 1**.

### Tolerance standard

SKF supplies all O-rings with dimensional tolerances in accordance with ISO 3601-1. The tolerance values are listed in **table 4**. They are suitable for any elastomer material provided that appropriate tooling is used, whereas the tooling most commonly used is based upon the shrinkage of nitrile rubber with 70 shA hardness.

Fig. 1

# Housing design and dimensions

## Housing dimensions for static radial sealing

O-rings for static (non-moving) sealing can be used in a wide variety of applications and arrangements. The most common arrangement in hydraulic cylinder applications is static radial sealing between coaxial cylindrical parts. The O-ring is installed in a groove that is machined either as an outside or inside groove (→ **fig. 1**) in one of the two cylindrical parts.

The housing dimensions for static radial sealing O-rings are listed in the product tables.

### Groove edges

All groove edges should be smoothed and rounded off to  $r = 0,1$  to  $0,2$  mm ( $0,004$  to  $0,008$  in.).

### Lead-in chamfers

All edges and openings through which the O-ring has to pass during the assembly should have appropriate lead-in chamfers and should be well rounded off (→ **table 6**). The chamfers facilitate assembly and protect the O-ring from damage during the mounting process. The O-ring and all surrounding parts should be well lubricated before assembly, preferably with the same fluid as used in the hydraulic system, ensuring compatibility with seals and cylinder components.

Table 6

## O-rings and back-up rings

### Extrusion gaps and back-up rings

The size of the permissible extrusion gap (→ *Gap extrusion*, page 34) depends mainly on the seal material, temperature and operating pressure. Harder materials (→ *Materials*, page 26) provide a certain resistance to gap extrusion. When the permissible extrusion gap for the pressure and temperature in application is exceeded, back-up rings may be used to prevent the seal pressing into the gap and causing extrusion damage and possibly even premature failure. **Figure 2** shows the O-ring behaviour at different operating pressures and conditions. In applications where the O-ring is exposed to pressure from one side only, the back-up ring is installed at the zero pressure side. For an O-ring exposed to pres-

sure from both sides, a back-up ring is installed on both sides.

For the extrusion gaps, SKF recommends a fit machined to tolerance classes f7(E) and H8(E).

**Diagrams 2 to 4** provide guideline values for the maximum extrusion gap in relation to the operating pressure for standard O-rings without back-up ring (→ **diagram 2**) and different back-up ring materials and ring sizes (→ **diagrams 3 and 4**). These guideline values are based on extensive tests conducted in SKF laboratories at 90 °C (195 °F) and 100 000 pressure pulses. However, other factors such as temperature and fluid can influence these guideline values and should be considered.

Fig. 2

#### O-ring behaviour at different operating pressures and conditions

For additional information about O-ring and back-up ring materials, refer to *Materials* (→ **page 292**) and about extrusion, refer to *Gap extrusion* (→ **page 34**).

### Groove width

To accommodate the additional back-up rings, the O-ring groove width  $L$  needs to be increased to  $L_1$  for one back-up ring or  $L_2$  for two back-up rings (→ **fig. 2**). The groove width dimensions are listed in the product tables.

Diagram 2

Guideline limit values for NBR O-rings, 70 shA

Diagram 3

Guideline limit values from test with OR 89.5×3-N70 and STR 90×95×1.3

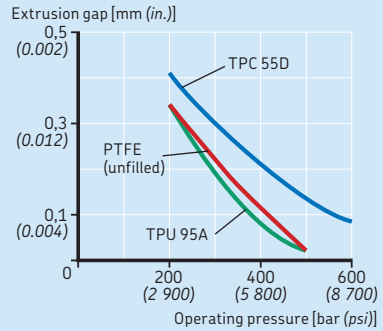

Diagram 4

## 6.2 OR O-rings in static radial sealing, inch sizes

Dash-number 004 – 155

SKF recommends designing O-ring housings according to ISO 3601. This table is a reference to O-ring sizes for common housing dimensions.

Dash-number	O-ring dimensions		Housing dimensions		Outside groove		Inside groove		Designation

## 6.2 OR O-rings in static radial sealing, inch sizes

Dash-number 156 – 274

SKF recommends designing O-ring housings according to ISO 3601.  
This table is a reference to O-ring sizes for common housing dimensions.

Dash-number	O-ring dimensions		Housing dimensions				Designation		
	CS	ID	L +0.008	R max.	Outside groove		Inside groove		
					D +0.002	d <sub>1</sub> -0.002	d -0.002	D <sub>1</sub> +0.002

## 6.2 OR O-rings in static radial sealing, inch sizes

Dash-number 375 – 475

SKF recommends designing O-ring housings according to ISO 3601.  
This table is a reference to O-ring sizes for common housing dimensions.

Dash-number	O-ring dimensions		Housing dimensions		Outside groove		Inside groove		Designation
	CS	ID	L +0.008	R max.	D +0.004	d <sub>1</sub> -0.004	d -0.002	D <sub>1</sub> +0.004

## 6.5 STR Back-up rings in static radial sealing, inch sizes

Dash-number 340 – 449

Back-up rings are selected by the corresponding O-ring dimensions.

Dash-number	Ring dimensions			Groove width		Designation

Other sizes are available on request

## Other O-ring sealing and ring materials

### Dynamic radial sealing

Under certain conditions, O-rings can be used for dynamic sealing with relative motion between the coaxial parts. These sealing arrangements are limited to slow reciprocating or oscillating motions. The radial section  $S$  should be increased to  $S_1$  using

$$S_1 = \frac{CS + S}{2}$$

where

$S_1$  = increased radial section [mm]

$CS$  = cross section [mm] (→ **product tables**)

$S$  = radial section [mm] (→ **product tables**)

For additional dimensions, refer to the relevant standards (→ **table 3, page 294**).

For additional information, contact SKF.

### Static axial sealing

O-rings can also be used for static axial sealing between two opposing parts. However, static axial sealing arrangements are not common in hydraulic cylinder applications, however, examples are shown in **figure 3**.

For additional information, contact SKF.

Fig. 3

#### Static axial sealing examples

Rectangular groove, inside pressure

Rectangular groove, outside pressure

Triangle groove

Trapezoidal groove

### PTFE encapsulated O-rings

SKF supplies O-rings, type ECOR, encapsulated with PTFE materials (FEP or PFA) and a core made of silicone or fluoroelastomer. The seamless and uniform PTFE encapsulation protects the core material against fluid and air.

ECOR O-rings are preferred for static sealing and not appropriate for continuously dynamic applications due to its thin and soft encapsulation. They are characterized by the following properties:

- chemical resistant
- wide temperature range
- anti-adhesive, low breakaway friction
- good resistance to wear
- good resistance to UV light
- can be sterilized in accordance with FDA (Food and Drug Administration) requirements
- low steam permeability
- low water absorption

For available sizes and additional information, contact SKF.

### Back-up rings made of polyester thermoplastic elastomer

SKF also supplies back-up rings made of polyester thermoplastic elastomer (TPC).

For additional information, contact SKF.

### Back-up rings made of PTFE

SKF back-up rings made of PTFE are suitable in applications with high temperatures or aggressive fluid. PTFE back-up rings are available unfilled or with an appropriate filler.

Back-up rings made of unfilled PTFE can be machined from tube blanks with outside diameters ranging from 1 to 1 500 mm (*0.039 to 59 in.*). Therefore, they can easily be adapted to customer specific installations and delivered on short notice.

For additional information, contact SKF.

# Other fluid power applications

Hydraulic rock breaker hammers . . . .	348
Hydraulic presses . . . . .	349
Hinge pin joints . . . . .	349
Rotary unions . . . . .	350
Hydraulic motors . . . . .	350
Pneumatic fluid power applications . .	351

## Other fluid power applications

*This catalogue contains the standard assortment of SKF hydraulic seals and guides typically used in hydraulic cylinders. Furthermore, SKF provides a wide range of standard and customized sealing solutions for a variety of other fluid power applications. In this chapter, you find some examples of these capabilities. For a solution that best meets the demands of your application, contact SKF.*

### Hydraulic rock breaker hammers

Hydraulic rock breaker hammers are a demanding application requiring hydraulic reciprocating seals working in short strokes and extreme high velocity.

SKF has many special solutions for rock hammers, including TEFLATHANE seals with a special high temperature TPU seal that is bonded to a low friction PTFE support base to extend service life for significant maintenance savings.

## Hydraulic presses

Each hydraulic press application is unique and should work reliably for many years without costly downtime or expensive repairs. SKF has decades of experience developing and manufacturing tailor-made press seal solutions for original equipment manufacturers, as well as retrofit assemblies for legacy equipment.

With moulded and machined seal capabilities and virtually unlimited diameter range, SKF can customize and manufacture sealing solutions to optimize system performance and increase performance and decrease operating costs.

## Hinge pin joints

Hinge pin seals retain pin joint bearing lubricants and exclude contaminants on off highway equipment that operates in harsh outdoor environments across all climates and weather conditions.

SKF PAK-L press-in seals are optimized for demanding pin joint applications. The wear resistant polyurethane seal materials reduce relubrication intervals and extend both seal and hinge joint bearing life. In addition, SKF has experience developing tailor-made pin joint seal solutions.

## Other fluid power applications

### Rotary unions

Rotary unions (also known as rotary manifolds or swivel joints) accommodate the flow of fluids between machine components with relative rotating or oscillating motion. They convey gases, lubricants, coolants and working fluids for fluid power.

SKF has sealing solutions and capabilities to accommodate virtually any rotary union application. The IM profile seal for hydraulic rotary manifolds is optimized for low friction and is available with a bonded energizer to improve energy efficiency and extend service life.

### Hydraulic motors

Hydraulic motors rotate with high torque from high-pressure hydraulic fluid flow. Certain motor designs and applications require the shaft seal to handle high pressure. The demands for higher power, efficient operation and long life require improvements over the typical rubber shaft seals.

SKF designs and develops tailor-made high-pressure rotary seals for hydraulic motors with PTFE sealing contacts for reduced friction and wear to increase energy saving and extend service life.

# Pneumatic fluid power applications

Special gas-sealing applications with high pressure, high speed, extreme high temperatures, cryogenic low temperatures or special gases place high demands on pneumatic seals.

SKF can provide a customized solution that meets your most demanding pneumatic sealing needs, designed specifically to enhance reliability and performance in your application.
