# FLEXIBLE MOUNTINGS

## I - INTRODUCTION

The **reduction of noise and vibration** has become very important:

- The need to improve conditions makes it essential.
- The increasing mechanisation of industrial and domestic activities make it necessary.
- The lightness and increasing complexity of equipment demand it.

The following pages are dedicated to protection against vibrations and shock. They offer design engineers the means to resolve isolation problems using elastomer alone or elastomer bonded to metal supports.

The first few pages start, therefore, with a summary of definitions and an explanation of the terminology used as well as the principal formulae on which suspension calculations are based. The design of a flexible mounting system is a major undertaking and is the subject of a special section which gives the principles used to select a mounting according to its size, characteristics, type and applications.

**Warning:** solving flexible mounting system problems very often requires the services of a specialist and we advise, very strongly, that if a simple solution cannot be found, then our Technical Services should be consulted.

## II - DEFINITIONS

### II.1 - FLEXIBLE MOUNTINGS

#### II.1.1 - Properties

- Flexible mountings are components which exhibit both flexibility and damping, at the same time and to varying degrees.

##### • Flexibility

- Flexibility is the ability of the mounting to deform and recover, with an amplitude approximately proportional to the load.

##### • Damping

Damping is a braking force the most important effect of which is the reduction of oscillations. There are essentially two types of damping:

- Constant friction (dry friction) which, for a given setting, provides a constant braking force independent of the movement. For there to be movement, it is, therefore, necessary to apply a force at least as great as the frictional force.

- Viscous damping (such as that provided by hydraulic dampers) which provides a braking force proportional to the instantaneous velocity of the suspended part relative to the fixed part. Viscous damping is, therefore, essentially dynamic: it does not affect the position of static equilibrium.

#### II.1.2 - Environmental conditions

Most of the standard mountings are made of natural rubber which has been chosen because of its good dynamic properties.

Under normal operating conditions, these rubber compounds guarantee stability over long periods and, in particular, limited creep.

The following operating conditions are considered abnormal:

- temperatures greater than 70°C,
- prolonged contact with corrosive liquids,
- prolonged contact with acids or alkalis,
- aggressive environment (oils, fuels),
- corrosive gases (ozone, chlorine...).

Using a mounting unintentionally under such conditions can lead to premature ageing, degradation or even destruction of the rubber.

An abnormally aggressive environment can, in particular, increase the deformation of the mounting (creep).

**PAULSTRA flexible mountings may be made using various special compounds that are highly resistant and able to withstand the abnormal conditions described above.**

**Our Technical Services are at your disposal to reply to any queries about the properties of particular compounds.**

#### II.1.3 - Elastomeric flexible mountings

Mountings using natural or synthetic elastomers always provide a combination of pure elasticity and viscous damping. Although commonly used, the term "shock absorbers" is completely incorrect. The two characteristics, flexibility and damping, are, in fact, essentially different: a rubber mounting may be compared to a car suspension where the two functions are provided by different components working in parallel:

- true elastic suspension provided by springs,
- damping provided by hydraulic damping (shock absorbers).

A flexible mounting using rubber = a spring + a damper.

## II.1.4 - Characteristics of elastomeric flexible mountings

### • Elastic properties

These are the parameters which define the ability of the mounting to be deformed in various directions.

- **The linear stiffness  $K_x$** , along the axis  $G_x$  is the ratio of the force to the corresponding displacement along this axis. The linear stiffness is expressed by daN/mm.

The linear stiffness ( $K_y, K_z$ ) for the other axes ( $G_y, G_z$ ) are defined in the same way.

- **The torsional stiffness ( $C_x, C_y, C_z$ )** about the three axes ( $G_x, G_y, G_z$ ) is the ratio of the torque to the angular displacement about the axis.

The torsional stiffness is expressed in m.daN/rad.

These six parameters, which are not independent of each other for a given mounting (the interdependence changes with the shape and structure of the mounting) are proportional to the Young's modulus of the elastomer used in the mounting.

Using these six values, it is possible to calculate the stiffness along or about any arbitrary axis.

### • Damping properties

The most useful parameter is the "intrinsic damping factor" of the elastomer used. This will be defined for a suspension (§ II.2.2). The intrinsic damping factor of a mounting is the same as that of the suspension.

## II.2 - FLEXIBLE MOUNTING SYSTEMS

A machine is suspended elastically by placing flexible mountings between the machine and its seatings (floor, slab, chassis, etc.). The type of mounting, its number, distribution, positioning and individual characteristics, depend on the overall characteristics required by the suspension to give the desired result.

The most common problems are those where vibration determines the essential characteristics of the suspension. It is necessary, therefore, to start with a presentation of the terminology and a review of the most important definitions and principles.

### II.2.1 - Vibration theory concepts

A machine, suspended elastically, vibrates when it is subject to periodic alternate influences which produce oscillations of greater or lesser amplitude.

There are two main modes of vibration:

- Natural or free vibration, which is the vibration of the machine that occurs when it is released after having been displaced from its position of equilibrium,
- Forced vibration, which is imposed on the machine, either by its own operation, or by influences from its surrounding.

### • Degrees of freedom

The number of degrees of freedom is the number of independent parameters which determine the position of the machine at any given time.

Degrees of freedom of movement:

- Linear movement parallel to a given axis (the independent parameter is the displacement along the axis),
- Rotation about a given axis (the independent parameter is the angle of rotation about the axis).

### • Vibrations with only one degree of freedom

The following discussion applies to vibrations with only one degree of freedom: a linear vibration parallel to a fixed axis.

#### • Periodic vibration:

- Frequency: Number of complete cycles in a unit of time.  
 $N$  = Number of cycles per minute.  
 $n$  = Number of cycles per second (Hertz).

- Period: Duration of one cycle.

$$T = \frac{1}{n} \text{ (seconds)}$$

- Angular frequency:  $\omega = 2\pi n = \frac{2\pi}{T}$  (radians per second).

- Maximum amplitude: The maximum offset from the equilibrium position for each cycle. For a forced vibration under constant conditions, the amplitude remains constant.

- Sinusoidal vibration  $x = A \sin \omega t$  (fig.1)

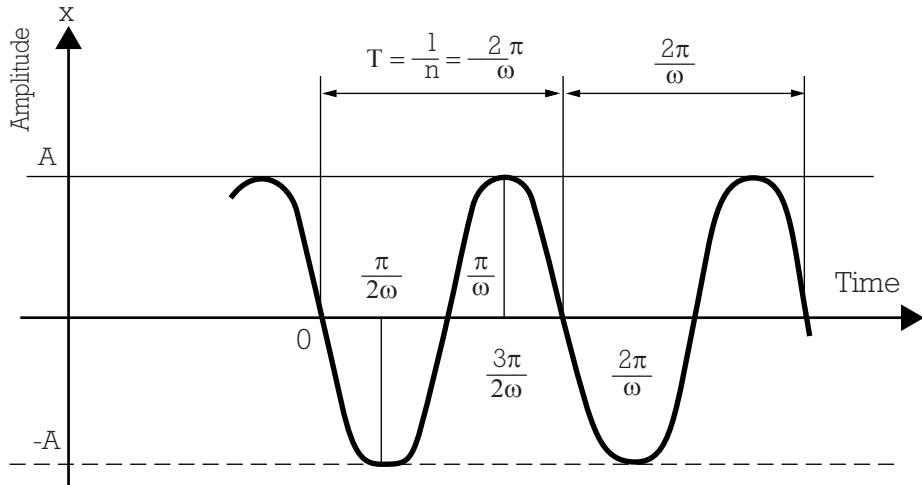

Fig. 1

$$- \text{Frequency } n = \frac{1}{T} = \frac{\omega}{2\pi}$$

- Amplitude A
- Maximum velocity  $V = A\omega$
- Maximum acceleration  $\Gamma = -A\omega^2$
- Instantaneous amplitude  $x = A \sin \omega t$
- Instantaneous velocity  $v = A\omega \cos \omega t$
- Instantaneous acceleration  $\gamma = -A\omega^2 \sin \omega t$

High frequency vibrations (high  $\omega$ ) may, therefore, produce very high accelerations even at low amplitudes.

## II.2.2 - Characteristics of flexible mounting systems

- Elastic properties

These are the parameters which define the freedom of a machine to move with respect to its seating. The movements are, usually, referred to an axis system ( $G_x, G_y, G_z$ ).

In the example in figure 2:

- The origin of the axis system is at the equilibrium position of the machine's centre of gravity.
- The axes are parallel to the axes of symmetry of the machine.

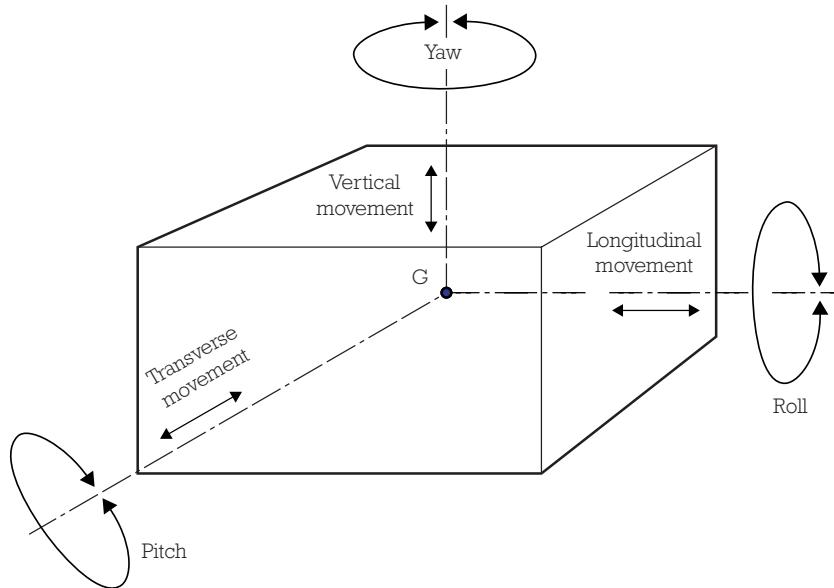

Fig. 2

As for mountings, the stiffness of a suspension is defined for displacements with only one degree of freedom relative to a fixed set of axes.

### - Linear stiffness:

$K_x$  along  $Gx$  = longitudinal movement

$K_y$  along  $Gy$  = transverse movement

$K_z$  along  $Gz$  = vertical movement

For each axis, the linear stiffness is the sum of the linear stiffness of all the mountings.

$$K_x = \Sigma k_x$$

$$K_y = \Sigma k_y$$

$$K_z = \Sigma k_z$$

### - Torsional stiffness:

$C_x$  about  $Gx$  = roll

$C_y$  about  $Gy$  = pitch

$C_z$  about  $Gz$  = yaw

The torsional stiffness of the suspension depends on:

- The individual stiffness of the mountings,
- The position and orientation of the mountings with respect to the centre of gravity G of the machine.

### • Damping properties

Elastomers exhibit viscous damping, the braking force applied to an elastic suspension is  $R \times V$ , where:

R is the resistance,

V is the relative velocity of the suspended machine at time t.

If, starting with an undamped suspension, the damping is progressively increased (with all other factors remaining constant) the amplitude of the free oscillations, starting from a given initial offset, die away more and more quickly.

**The value of damping for which the return to the equilibrium position is asymptotic (without oscillation) is called the “critical damping” and is denoted by a resistance  $R_c$ .**

The damping factor  $\epsilon$  is defined for a resistance R:

$$\epsilon = \frac{R}{R_c} \quad (\epsilon = 1 \text{ for critical damping})$$

When suspension is subjected to forced vibrations at a frequency  $\omega$ , it has been shown that, for natural elastomers, the product  $\epsilon \omega$  remains reasonably constant. This is equally true at the resonant frequency (see below).

$$\epsilon \omega = \epsilon_0 \omega_0 \text{ constant } (\omega_0: \text{is the resonant frequency}).$$

$\epsilon_0$  being the damping factor at the resonance frequency.

It can be shown that  $\epsilon_0$  is an intrinsic property of the elastomer used.

$\epsilon_0$  = intrinsic damping factor.

$\epsilon_0$  of a suspension =  $\epsilon_0$  of each mounting (if all mountings use the same elastomer).

### • Electrical characteristics

Elastomers have an electrical resistance which varies according to their composition, hardness. As a guide, the following values have been measured for our standard elastomers.

Natural Rubber	hardness 45	$10^{13}$	Ohm x cm /cm
	hardness 60	$10^6$	Ohm x cm <sup>2</sup> /cm
	hardness 75	$10^4$	Ohm x cm <sup>2</sup> /cm

We have also developed special elastomers which can have a dielectric strength greater than 2,000 Volts for 1 minute.

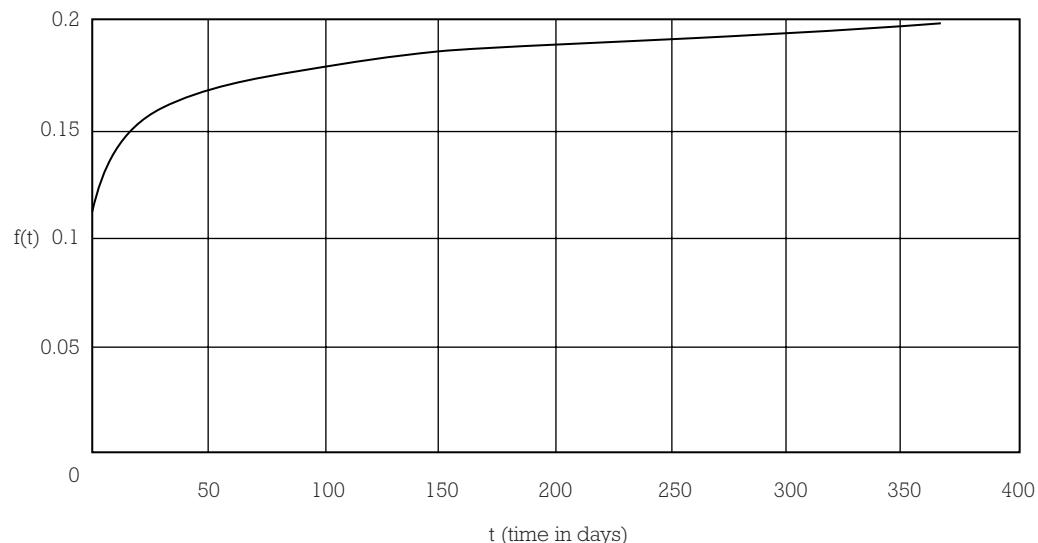

## • Creep characteristics

The following formula, which is derived from measurements on samples, gives an estimate of the creep for a load which compresses a Radiaflex mount by 10% of its height at a temperature of 30°C.

The creep for an actual mounting also depends equally on its shape.

Static deflection at time  $t$  = initial static deflection  $x$   $(1 + C_m \times f(t))$   
where  $f(t)$  is the value of the creep from the graph below:

**Creep  $f(t)$  in compression relative to the initial static deflection.**

and  $C_m$  is a correction coefficient taken from the table below according to the sample material:

Material	Hardness 45	Hardness 60	Hardness 75
Standard natural rubber	1.0	1.6	1.7
Polychloroprene	1.1	1.6	1.6

### Note:

These values are given as a guide only. Consult us for use under other conditions (temperature, complex profiles or other elastomers).

### Mounting:

For applications where alignment is important, to overcome the problems of initial creep of the elastomer mountings, adjustment to align the axes of shafts should be made at least two days after the machine has been mounted.

# III - FUNCTION OF A FLEXIBLE MOUNTING SYSTEM

## III.1 - STATIC FUNCTION

An elastic suspension allows the static load to be more evenly distributed.

If a machine rests on more than three points using "rigid" mountings, it is impossible to predict the load on each mounting and the machine could be unevenly stressed.

With elastic mountings having known stiffness, it is possible to determine (by calculation, or direct measurement) the deflection in each mounting and thus deduce the loading and correct any imbalance.

An elastic suspension accommodates minor differences in the distance between mountings. However many mountings there are, in order to avoid excessive local stresses, a rigid assembly requires very close tolerances on the distance between mountings and of the mating surfaces of the machine and its seatings.

To avoid prohibitively close manufacturing tolerances, "play" is allowed in the mountings which gives rise to the well known problems of wear and noise due to loose fixings.

Flexible mountings allow larger manufacturing tolerances without large variation in forces.

An elastic suspension can also absorb small movements due to, for example, the expansion or the deformation of chassis, bodyshells, girders, etc.

## III.2 - DYNAMIC FUNCTION

This is the primary function of elastic suspensions where there is vibration or shock. The calculations presented here assume that the linear stiffness of the mountings remains constant. This is true for elastomeric mountings in normal conditions of use (mechanical vibration, normal temperature).

### III.2.1 - Vibrations with only one degree of freedom

The action of a flexible mounting system is very complex. To present the principles, we will study a simple idealised case (fig. 3).

Taking the case of a machine of mass  $M$  constrained so that it can only move in a direction parallel to the vertical axis  $Gz$ .

It is attached to its seatings by a flexible mounting  $S$  with a stiffness  $K$  along the axis  $Gz$ .

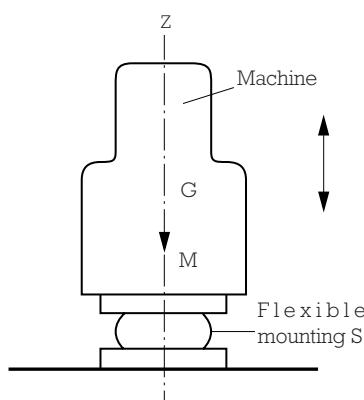

Fig. 3

## • Free oscillation (natural frequency)

### a) Undamped (entirely theoretical)

The machine, having been displaced from its position of equilibrium by a distance A, oscillates sinusoidally.

The equation of motion is:  $z = A \sin \omega_o t$

$$\text{The natural pulsation is } \omega_o = \sqrt{\frac{K}{M}} \quad \text{Proper frequency } F_p = \frac{\omega_o}{2\pi}$$

The oscillation continues indefinitely with an amplitude A (as shown in Fig. 1 with  $\omega$  replaced by  $\omega_o$ ).

### b) Damped

In this case, the machine oscillates about its position of equilibrium with a damped sinusoidal motion (see Fig. 4).

The equation of motion is:

$$z = A e^{-\epsilon'_o \omega'_o t} \sin \omega'_o t$$

The natural pulsation is:

$$\omega'_o = \sqrt{\frac{K}{M} (1 - \epsilon'^2_o)} = \omega_o \sqrt{1 - \epsilon'^2_o}$$

$\epsilon'_o$  is the damping factor at the frequency  $\omega'_o$ .

As  $\epsilon'_o$  is very close to  $\epsilon_o$ , the natural frequency may, therefore, be written as:

$$\omega'_o \approx \omega_o \sqrt{1 - \epsilon^2_o}$$

For natural rubber,  $\epsilon_o$  is small by comparison with 1 (from 0.02 to 0.1).

$\omega'_o$  is, therefore, very close to  $\omega_o$ .

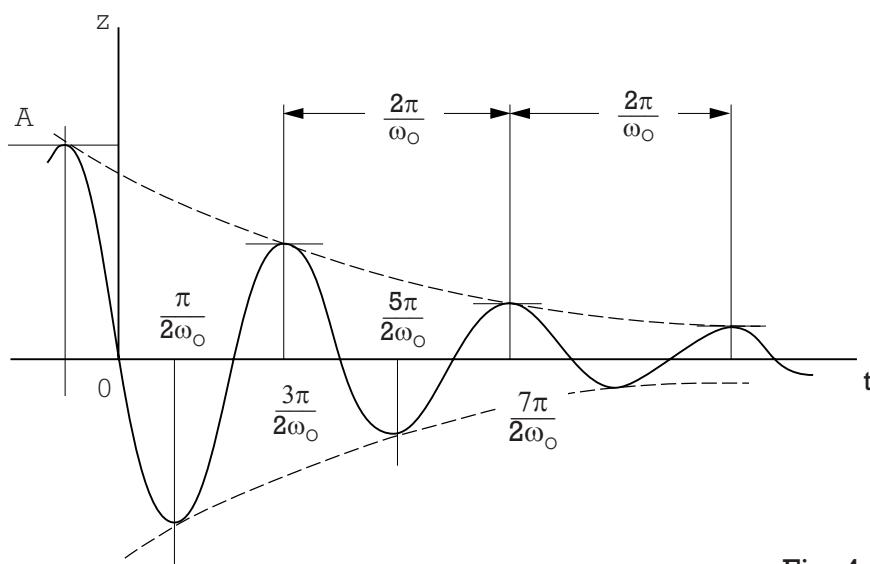

Fig. 4

## • Forced Vibration

If the machine is now subject to forced vertical vibration induced by a sinusoidal force of frequency  $\omega$ .

The inducing force is  $F = F_M \sin \omega t$ .

- **For a rigid suspension:** the inducing force is transmitted directly to the structure the machine is mounted on.

- **For an elastic suspension** with a natural frequency  $\omega_0$  or proper frequency  $F_p = \frac{\omega_0}{2\pi}$  and damping factor  $\epsilon_0$ :

When the inducing force is applied, an oscillation is induced at the natural frequency  $\omega_0$  which dies away rapidly so that, after a short period, only the steady state forced vibration at frequency  $\omega$  remains which transmits a sinusoidal force to the surrounding structure.

The force transmitted is:  $F' = F'_M \sin \omega t$ .

A transmission coefficient  $\lambda$  is defined as the ratio between the amplitude of the force transmitted  $F'_M$  to the amplitude of the inducing force  $F_M$  (or, if preferred, the force that would be transmitted if the suspension was not elastic).

For a mounting system using elastomeric mounts, this coefficient is:

$$\lambda = \frac{F'_M}{F_M} = \sqrt{\frac{1 + 4 \epsilon_0^2}{\left(1 - \frac{\omega^2}{\omega_0^2}\right)^2 + 4 \epsilon_0^2}}$$

To summarise:

	Inducing force	Transmitted force	Transmission coefficient
Rigid system	$F = F_M \sin \omega t$	$F = F_M \sin \omega t$	$\lambda = 1$
Flexible system ( $\omega_0, \epsilon_0$ )	$F = F_M \sin \omega t$	$F' = F'_M \sin \omega t$	$\lambda = \frac{F'_M}{F_M} = \sqrt{\frac{1 + 4 \epsilon_0^2}{\left(1 - \frac{\omega^2}{\omega_0^2}\right)^2 + 4 \epsilon_0^2}}$

The variations of the transmission coefficient  $\lambda$ , as a function of  $\frac{\omega}{\omega_0}$  for various values of  $\epsilon_0$  are shown in fig. 5 (page 12).

## Attenuation

For rubber mountings, the term  $4 \epsilon_0^2$  is much smaller than 1. The attenuation in % is  $1 - \lambda$ :

$$E\% = 100 \frac{\left(\frac{\omega}{\omega_0}\right)^2 - 2}{\left(\frac{\omega}{\omega_0}\right)^2 - 1} \quad \text{or} \quad 100 \left(1 - \frac{1}{\left(\frac{\omega}{\omega_0}\right)^2 - 1}\right)$$

For a given induced frequency  $\omega$  the attenuation depends on the natural frequency of the suspension.

For a particular direction, the relationship between the natural frequency, the suspension's sub-tangent and the induced frequency are plotted on the chart fig. 6.

For a particular induced frequency (for example 1500 rpm) it is possible to find the sub-tangent which will provide an acceptable attenuation. In general, an attenuation greater than 50% is required. For this example, the chart indicates that an attenuation of 80% will be achieved for a natural frequency of 10 Hz (see section IV.3.1).

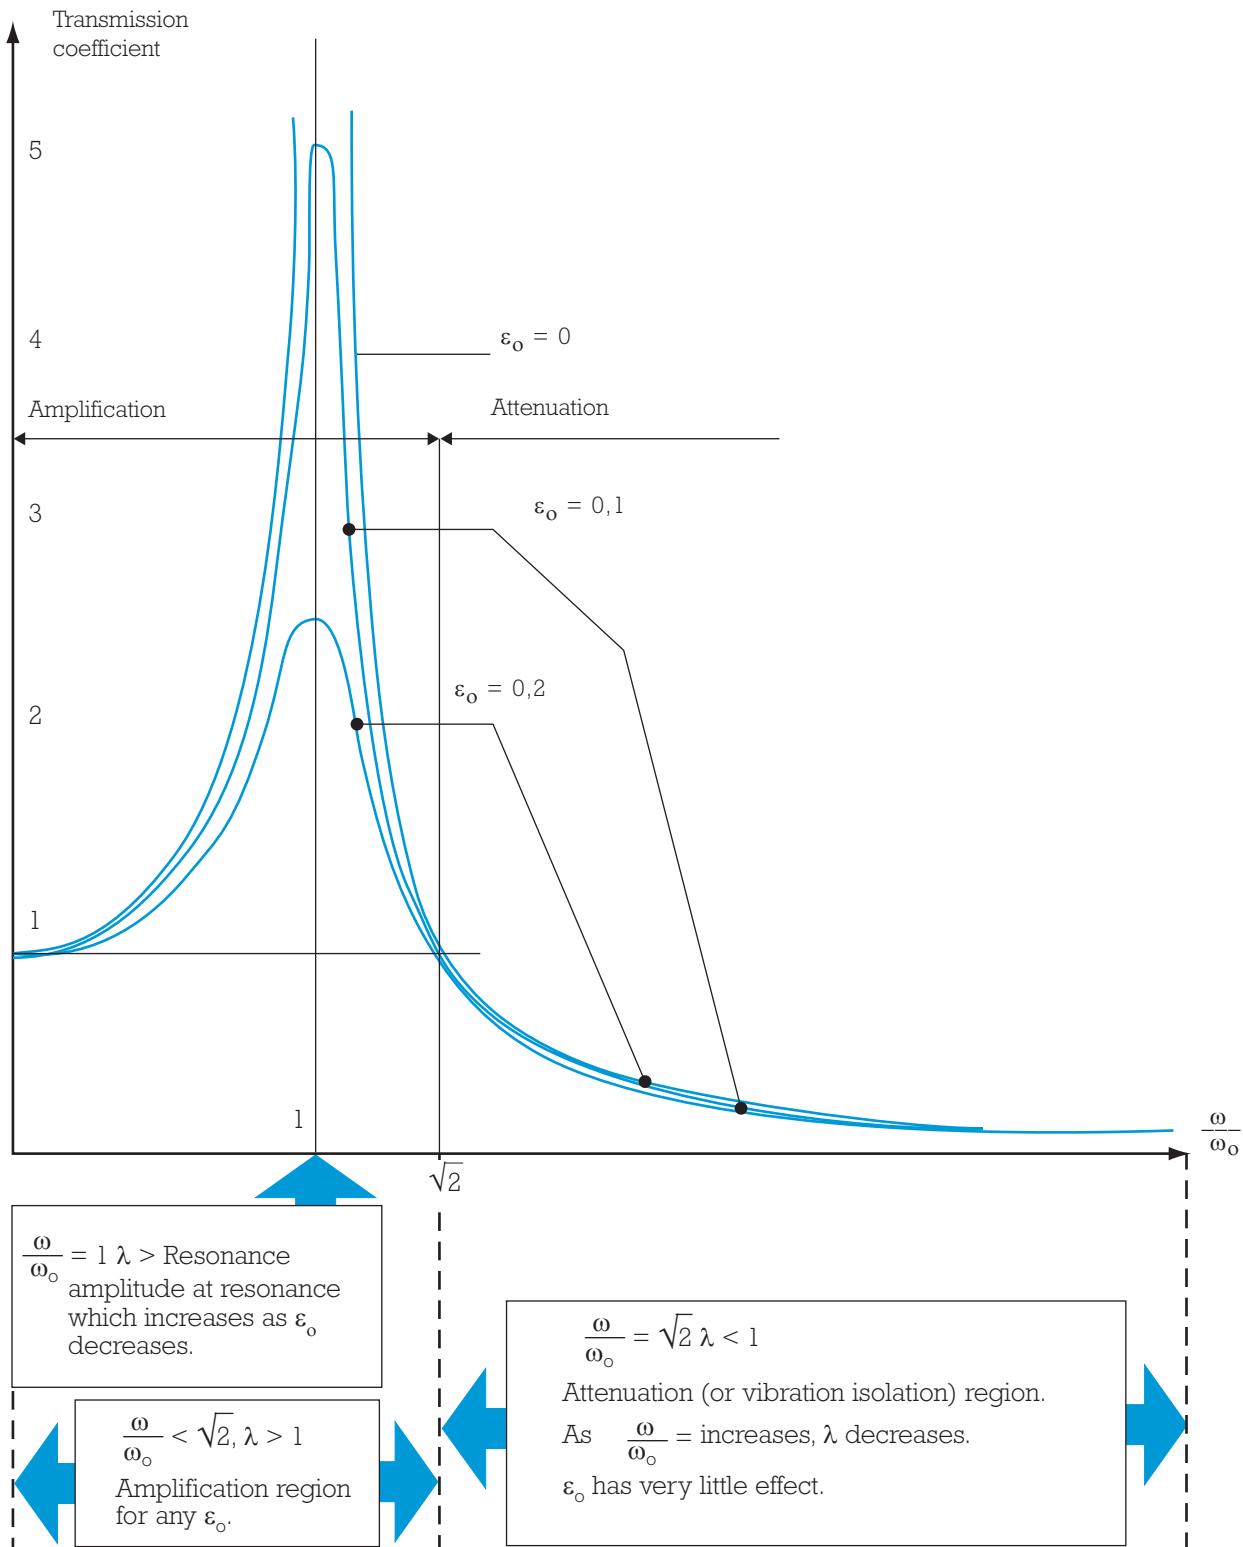

Fig. 5

An efficient mounting system use:

a high value of  $\frac{\omega}{\omega_0}$   $\longrightarrow$  low value of  $\omega_0$   $\longrightarrow$  low value of  $\lambda$

a moderate  $\epsilon_0$   $\longrightarrow$  - limited amplification in the resonant region.  
- minor effect in the attenuation region.

Attenuation as a function of natural frequency and frequency of excitation.  
(A theoretical graph for a mounting system without damping)

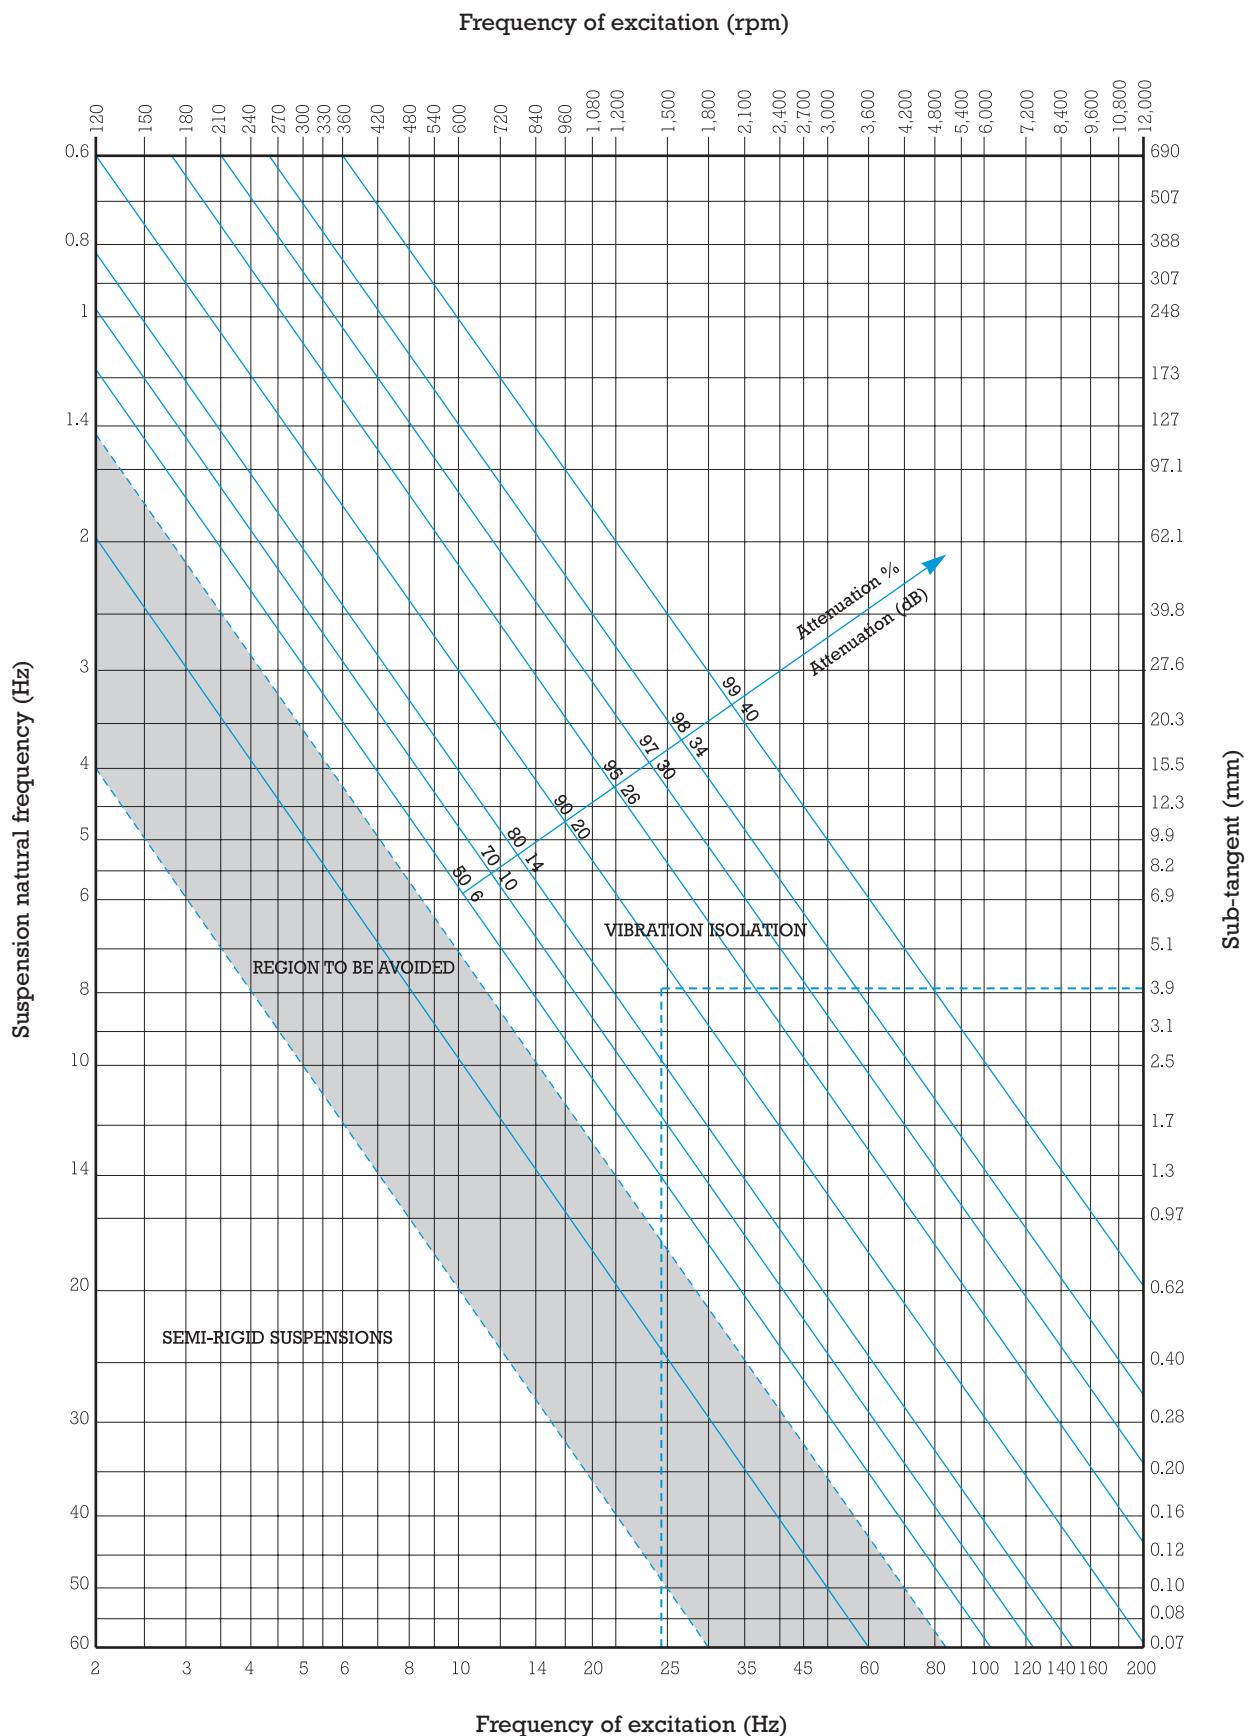

Fig. 6

## ● Practical considerations

### a - Variable speed machines

In practice, there may not be a single, well defined value for  $\omega$ , as machines may have a variable speed (variable  $\omega$ ).

In these cases, the vibration isolation should be determined for the lowest speed.

### b - Passing through resonance

All machines must start and stop.

Starting from rest to reach the speed  $\omega$  (in the vibration isolation region), it is necessary to pass through the resonant region.

It is necessary to ensure:

- that the passage through resonance is as quick as possible;
- that the suspension is sufficiently well damped so that the maximum force transmitted presents no risk for the machine, the suspension or the seating.

### c - Elastomeric suspensions

For the elastomers currently used in flexible mounting systems, the intrinsic damping factor  $\epsilon_0$  lies between 0.02 and 0.1 (it can be as high as 0.2 with synthetics such as butyl rubber).

- In the vibration isolation region, the formula for the transmission coefficient is simplified as, for the values of  $\epsilon_0$  for natural rubber, the term  $4\epsilon_0^2$  is negligible by comparison with 1.

$$\lambda = \frac{1}{\frac{\Omega^2}{\omega_0^2} - 1} \quad \text{for } \epsilon_0 \text{ between 0.02 and 0.1}$$

$$- \text{At resonance } \lambda_r = \frac{1}{2\epsilon_0}$$

$$\lambda = \frac{1}{2\epsilon}$$

For natural rubber, therefore, the amplification at resonance is between:

$$\frac{1}{2 \times 0.1} = 5 \quad \text{and} \quad \frac{1}{2 \times 0.02} = 25$$

### a) Noise and vibration

**Noise** is a random vibration. It is formed by the combination of a number of uncorrelated fundamental frequencies. Noise gives rise to **sound**.

Airborne noise is usually treated separately from structure borne noise.

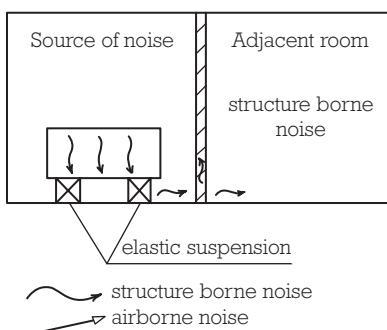

**Sound** is associated with the disturbance of a medium (solid, liquid or gaseous). This disturbance is in the form of a vibration of the molecules of the medium about their position of equilibrium.

### b) Improving acoustics

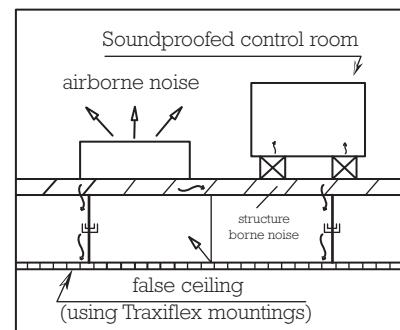

An elastic suspension affects only structure borne noise.

This is a vibration of the building structure and a flexible mounting system breaks the transmission close to the source. The resilience of the attachment reduces the forces transmitted to the base and its vibrational energy.

Transmission from one room to another

Example: Workshop with guillotine (shock and noise)

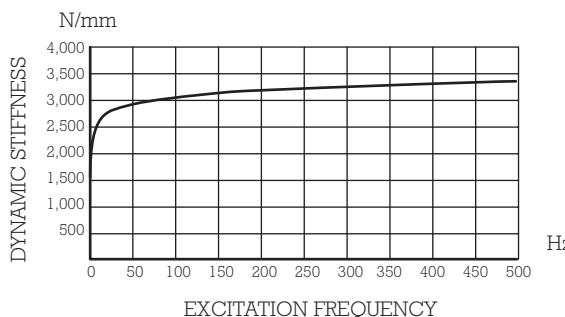

As the radiation efficiency is unchanged, the improvement in terms of radiated power (acoustic) is the same as the improvement in terms of the force transmitted. The curve giving the vibrational attenuation in % may be translated into decibels.

Attenuation in dB is  $20 \log \frac{100}{100 - E}$  where E is the attenuation in % (structure borne, not airborne noise).

The suspension of the machinery allows the **adjacent room** to be sound insulated and to be made more quiet.

The rigidity of the base supporting the suspended mass must always be taken into account. As a rule, it is considered that unless the mountings are ten times more flexible than the base the choice of suspension must be re-considered.

PAULSTRA mountings may be characterised at high frequencies.

Example of measurements made on a special Radiaflex mounting.  
Elastomer: polychloroprene hardness 47  
Amplitude  $\pm 0.01$  mm about the position under static load

### III.2.3 - Shocks

#### • The nature of shocks

For a given period, the equipment is subjected to a brief, impulsive excitation. It is the most severe type of excitation that it may encounter during its lifetime.

During the period that the excitation is applied, the speed of the equipment will vary: it is subject to acceleration and, therefore, to a force.

A system that reacts slowly will not be subject to the same shock as a system that reacts quickly. It is necessary to compare the length of period that the stimulus is applied, against the natural frequency of the equipment.

#### • Types of shocks

In practice, there are two types of problems.

- The equipment is subjected to shocks which are well defined by experiments, but are very complex and not reproducible under laboratory conditions. It is, therefore, necessary to define an equivalent shock.
- The equipment must resist shocks which are arbitrarily defined (e.g. meeting standards). A shock is defined by an excitation which varies with time: the acceleration, the speed or the displacement of the point where the excitation is applied. In some cases, it is better to define the shock as the energy transferred to the equipment (e.g. vehicle impact).

#### • Protection against shocks

There are two principal cases to be considered:

##### a) Limitation of the force transmitted to the equipment:

This case often appears in the following form:

The equipment, moving at a known speed, meets an obstacle. The force that it can withstand without damage is limited to a known value.

A system of rubber parts, which could be the flexible mounting system of the equipment, is placed between the equipment and the obstacle.

These parts provide a constant stiffness  $K_z$  in the direction of the shock. If there is energy  $W$  to be absorbed in the absence of damping:

$$W = \frac{1}{2} K_z Z^2 \quad \text{The maximum force } F_M = K_z Z = \frac{2W}{Z} \quad \text{The maximum force is inversely proportional to the travel.}$$

$$\text{The travel } Z = \sqrt{\frac{2W}{K_z}} \quad \text{The travel is inversely proportional to the square root of the stiffness.}$$

**Note:** Some systems do not have a constant stiffness, but a stiffness which increases rapidly (e.g. compression systems). It is clear that if the energy  $W$  is not absorbed before the stiffness increases, the maximum force will be much higher than predicted by this formula.

### b) Limiting the acceleration of particular parts of the equipment

In this case the shock must be described in terms of its potential to destroy. The efficiency of the protection system is measured by its ability to reduce this potential.

A shock to the equipment can damage a component part if this part is induced to vibrate at an amplitude which is incompatible with its mechanical characteristics thus causing it to break.

A shock can be characterised by its action on a whole series of components.

For the same shock, each component has its own specific response, which differs from one component to the next.

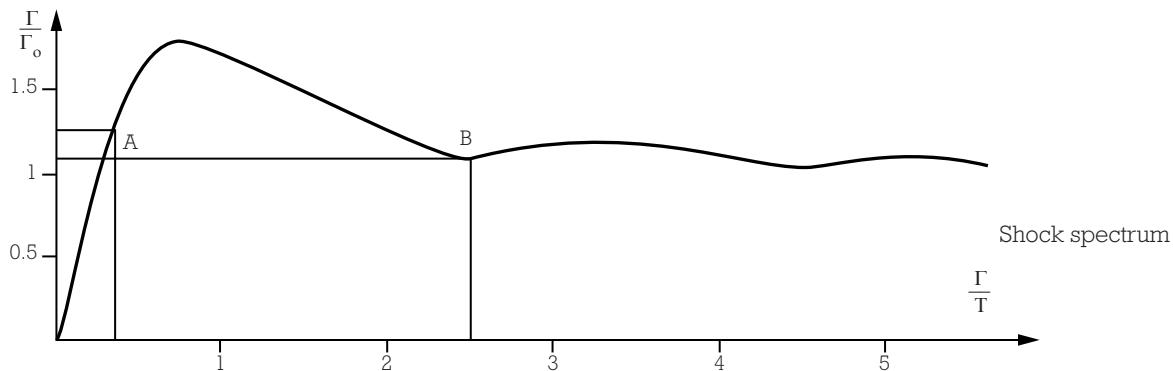

The shock spectrum is the graphical representation of the ratio of amplitude of vibration ( $\Gamma$ ) of the components to the amplitude of the shock ( $\Gamma_0$ ) as function of the ratio of the duration of the shock  $\tau$  to the natural frequency  $T$  of the elements.

This is not a representation of the amplitude as a function of time, neither of the excitation nor of the effect, but a convenient representation of the destructive power of a shock.

The representation is not reversible.

- It is not possible to recover the form of the shock from the spectrum.
- Two different shocks may well produce the same spectrum.

Take, for example, the case of shock with a semi sinusoidal acceleration.

A piece of equipment must withstand a shock of  $\Gamma_0 = 400 \text{ m/s}^2$  for a period  $t = 8.75 \times 10^{-3} \text{ s}$ .

	Component A of the equipment	Component B of the equipment
Natural frequency mass	40 Hz 10 kg	286 Hz 1 kg
$\frac{\tau}{T}$	$8.75 \times 10^{-3} \times 40 = 0.35$	$8.75 \times 10^{-3} \times 286 = 2.5$
$\frac{\Gamma}{\Gamma_0}$	1.25	1.1
Load on mounting points	$400 \times 1.25 \times 10 = 5000 \text{ N}$	$400 \times 1.1 \times 1 = 440 \text{ N}$

Study of the spectrum shows that the performance of a mounting system is acceptable when it is possible to obtain a natural frequency  $T$  such as:

$\frac{\tau}{T} <$  in which case the ratio  $\frac{\Gamma}{\Gamma_0}$  is less than 1 and the component is protected.

If it is not possible, it is better to set up the flexible mounting system to avoid the region of significant amplification for:

$$\frac{\tau}{T} \text{ between } 0.25 \text{ and } 2.5$$

This simple case shows the role of a flexible mounting system and the importance of knowing the details (shock spectrum, amplitude as a function of time) and, above all, the duration of the shock.

### • The role of damping

Damping can be useful in reducing rebounds and the amplitude of successive cycles of oscillation. It is, however, important not to use just any type of damping as some can give rise to unfortunate reactions. Elastomers provide a compromise which allow the provision a high level of protection.

### • Important note

Two points must always be borne in mind when designing equipment:

- Firstly, that a high level of protection requires great flexibility which requires considerable clearance between the equipment and its surrounding.
- Secondly, that the equipment will oscillate and room must be allowed for the rebound in case of shock. Travel limiters must be positioned so that they do not impede the operation of the flexible mounting system during the shocks allowed for in the design.

A flexible mounting system using rubber protects against shock by reducing the travel and maximum force. It is necessary to allow enough clearance for the rebound.

### III.2.4 - General case

**Theoretical study** above is based on a very simple case:

movement with only one degree of freedom (vertical) with only one excitation (also vertical) aligned with both the centre of gravity of the suspended machine and the centre of elasticity of the mounting system.

**In general**, things are not so simple. The machine can move in any of the degrees of freedom (rotation or linear movement). In theory, there are as many **natural frequencies** as there are degrees of freedom.

These natural frequencies are not independent but are "**coupled**". If one of these is excited in one degree of freedom, it can, as a result of the **coupling**, give rise to vibrations at the same frequency in other degrees of freedom.

To analyse the whole behaviour, the **stiffness** in all directions needs to be taken into account and not just the mass of the suspended body but also the **moments of inertia** so that rotational behaviour can be evaluated.

In addition there may be not one but several forced vibrations, with variable frequencies applied to several different points, in various directions or about various axes.

Even general cases can be very complex however symmetrical structures and mounting arrangements allow the use of the single degree of freedom analysis shown above. In other cases only an in-depth study allows an effective solution to be found. Our Technical Services are there to help you to define it.

## III.3 - VARIOUS TYPES OF FLEXIBLE MOUNTING SYSTEMS

### III.3.1 - Active isolation system

This is a flexible mounting system designed to prevent a machine from transmitting its vibrations to its seating or foundation.

This is the theoretical problem (with one degree of freedom which was treated, by attenuating the vibration, in the preceding pages).

The vibration isolation does not stop the machine from vibrating, but it reduces the transmission of these vibrations.

By comparison with a rigid suspension (which transmits the vibrations) the amplitude of the machine's vibrations may be greater. The machine is, to an extent, freed from its fixed seating. This is the case for the automobile "floating engine" which, mounted on a flexible mounting system, no longer transmits its vibrations to the bodywork and the passengers due to increased mobility under the bonnet (hood).

If excessive movement cannot be tolerated, the only way to reduce it, without reducing the efficiency of the flexible mounting system, is to increase the suspended mass (ballasting).

For a given excitation, the amplitude is inversely proportional to the mass.

This is necessary for certain machines which produce particularly severe vibration: slow single cylinder compressors, centrifuges, power hammers etc.

These machines, are therefore, fixed rigidly to a chassis or heavy slabs and the whole assembly is suspended.

Increasing the suspended mass allows good vibration isolation with limited vibration of the suspended assembly.

It is worthwhile suspending complete assemblies rather than individual machines: generating sets, motor/compressor units, motor/pump units.

### III.3.2 - Passive isolation system

This is a flexible mounting system designed to protect a non-vibrating machine from the vibrations of its surroundings.

The design of a flexible mounting system for attenuating vibration, as defined above, is still valid. With the correct flexible mounting system, the acceleration transmitted to the machine is very small and as it is not subject to any other excitation it remains almost stationary.

The vibration of the supporting structure is almost entirely absorbed by the flexible mountings.

### III.3.3 - Semi-rigid mounting system

This is a suspension where there is no vibration isolation for a given frequency  $\omega$

$$\left( \frac{\omega}{\omega_0} < \sqrt{2} \right)$$

As shown above, such a mounting system should be of no interest as it leads to an amplification of the vibration, not an attenuation. In practice, it can, however, give reasonable performance in the following two cases.

#### • Coupling

In practice, there is not just one movement. For a mounting system, several movements are possible. In fact, as we have seen (fig. 2), a machine may have six degrees of freedom. A proper study of a mounting system will take into account the type of excitation acting on the machine and try to arrange that it does not vibrate in all directions. However, because of constraints on mounting points, the mountings may not always be put in ideal positions: if the machine is subject to an excitation in one direction, it may, therefore, move in several directions, e.g. two. These two movements are said to be "coupled".

The natural frequencies in each direction are not identical. The coupling between the two movements has the effect of lowering the lower natural frequency and raising the higher. Instead of having one maximum (fig. 5), the response curve has two. It is essential the excitation does not fall on one or the other. As it may demand an impossibly high flexibility, it is not always possible to make the coupled natural frequencies sufficiently low to put the frequency of the excitation in the vibration isolation region. On the other hand, if the two natural frequencies are placed on either side of the frequency of the excitation, a modest attenuation may be obtained.

#### • Harmonics

A vibration of frequency  $\omega$  is rarely "pure". Frequently it also includes "harmonics"; i.e. vibrations at related frequencies  $2\omega$ ,  $3\omega$  ... Even if it is not possible to provide vibrational isolation of the fundamental  $\omega$ , it may be possible to attenuate the harmonics. This may be more important as the low frequencies are often inaudible and, in addition, correspond to very small mechanical accelerations whereas the higher frequencies are a source of noise which can be eliminated by an appropriate vibration isolator.

### III. 3.4 - External connections

So far, it has been assumed that the machine is only connected to its surrounding by its flexible mounting system.

In practice, there will be other connections, such as:

- Pipework (inlet, exhaust, cooling).
- Electric cables, remote controls...

It is necessary to ensure, or arrange, that these external connections are sufficiently flexible with respect to the relative movements.

This precaution will avoid:

- Damage to pipework.
- Reduced vibration isolation by introducing additional rigidity.
- Direct transmission, via these connections, of the vibrations which have been suppressed elsewhere.

As the flexible mountings attenuate the transmission of the vibrations the machine is free to move, be sure to leave enough clearance in all directions to allow freedom of movement.

## IV - DESIGNING A FLEXIBLE MOUNTING SYSTEM

When designing a flexible mounting system, it is essential to know precisely the basic characteristics of the machine to be suspended.

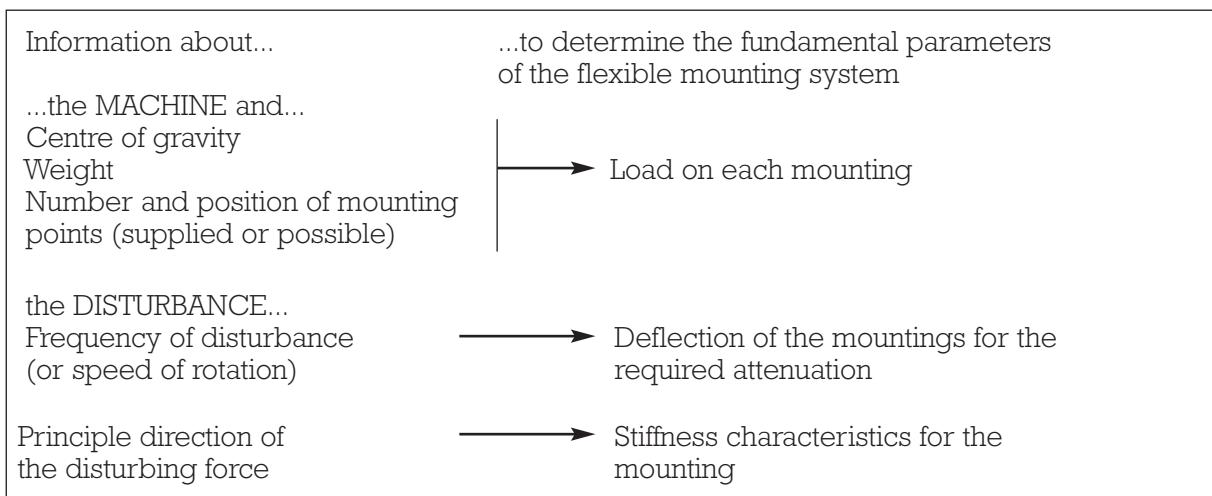

It is extremely useful to have a drawing (even if it is schematic) which shows the position of the centre of gravity and the mounting points provided.

The drawing may also allow the evaluation of certain parameters which may be necessary and which are often unknown to either the manufacturers or the users (e.g. moments of inertia).

For passive isolation, it is necessary to obtain the maximum of information about the external vibrations which may disturb the machine.

In any case, for complex problems (oscillations in many degrees of freedom, multiple excitation), it is advisable to consult our Technical Services.

For simple problems (one degree of freedom, or two degrees of freedom with the centre of gravity close to the mounting plane) it is possible to design the suspension, as shown below, with a minimum of information about the machine and the disturbance.

### IV.1 - DETERMINING THE CENTRE OF GRAVITY

#### IV.1.1 - Ask the manufacturer

In most cases, the manufacturer of the machine should be able to supply the exact position of the centre of gravity as well as the weight.

Consult the manufacturer.

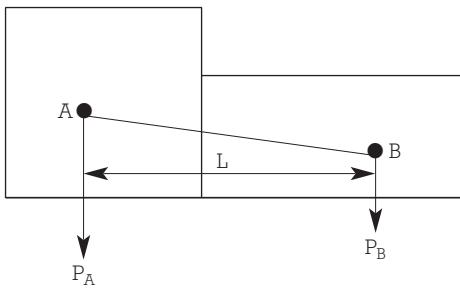

#### IV.1.2 - Graphical method for finding the centre of gravity of an assembly

This is suitable for assemblies of units for which the individual weights and centres of gravity are known.

##### Important notes:

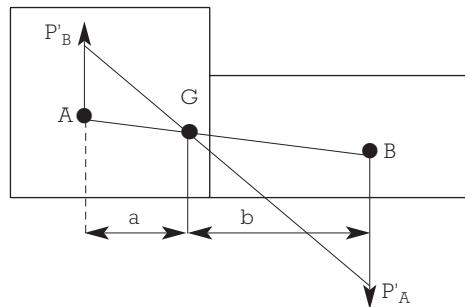

- Using a graphical method, it is important to represent dimensions using a well determined scale and the weights by vertical lines whose lengths are proportional to their size (e.g. 1 cm for 10 daN).
- If the centres of gravity considered in this section are not in the same vertical plane, the procedures proposed here should be applied twice: for the front and for the side view with the outlines corresponding to each view.

- An assembly of two units

**Fig. 7**

Two units of weights  $P_A$  and  $P_B$  respectively with centres of gravity A and B separated by L.

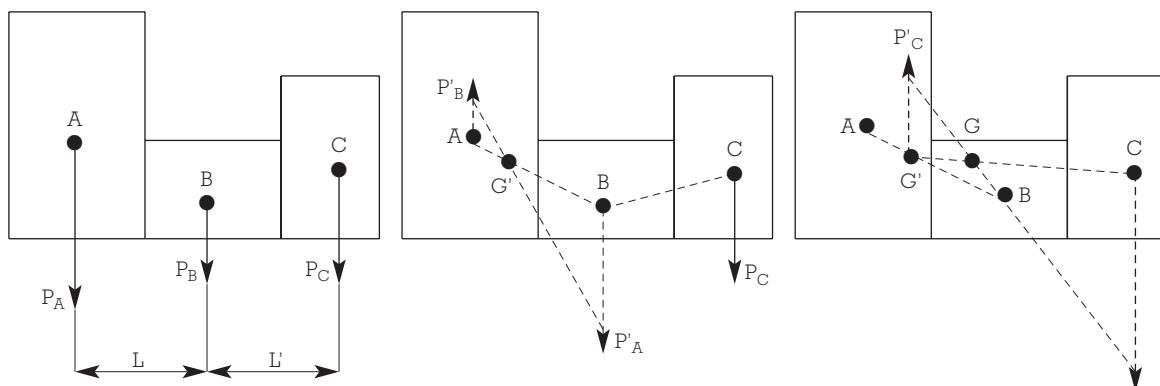

**Fig. 8**

Draw:  $AP'_B = BP_B$       Join  $P'_A$  and  $P'_B$   
 $BP'_A = AP_A$   
The centre of gravity G lies at the intersection of the lines  $P'_A$ ,  $P'_B$  and AB.  
Measure a and b.

- An assembly of three or more units

Proceed, stage by stage, as described above using groups of two units or sub-assemblies with centres of gravity and weight known or calculated.

**Fig. 9**

#### IV.1.3 - Experimental determination of the centre of gravity of a unit

This method is used where the above two methods prove to be impossible or difficult (complex geometry).

- Using a roller

For a given orientation (length, width and height) the centre of gravity is in the vertical plane passing through the axis of the roller when the machine is balanced. The centre of gravity is at the intersection of the three planes thus determined.

- By "hanging"

Suspended from a cable, the centre of gravity is on the vertical dropped from the suspension point. To find the exact centre of gravity, repeat the operation twice, using a different suspension point each time.

#### IV.1.4 - Analytical determination of the centre of gravity of an assembly of several masses

An assembly of several masses  $m_1, m_2, \dots, m_n$  is fixed in space.

It is assumed that the coordinates, within an arbitrary Cartesian set, of each mass are known.

$$m_1 \left\{ \begin{array}{l} X_1 \\ Y_1 \\ Z_1 \end{array} \right.$$

$$m_2 \left\{ \begin{array}{l} X_2 \\ Y_2 \\ Z_2 \end{array} \right.$$

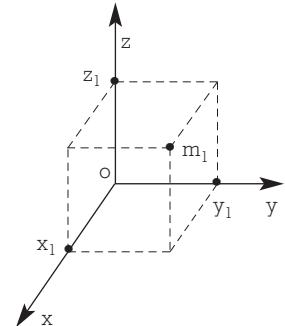

$$m_n \left\{ \begin{array}{l} X_n \\ Y_n \\ Z_n \end{array} \right.$$

The mass of the assembly  $M = m_1 + m_2 + \dots + m_n$  acts at the coordinates of the centre of gravity of the whole:  $x, y, z$

$$x = \frac{m_1 x_1 + m_2 x_2 + \dots + m_n x_n}{M}$$

$$y = \frac{m_1 y_1 + m_2 y_2 + \dots + m_n y_n}{M}$$

$$z = \frac{m_1 z_1 + m_2 z_2 + \dots + m_n z_n}{M}$$

**Important note:** The coordinates of the centres of gravity may be negative and must be used with their sign.

## IV.2 - DETERMINING THE LOAD PER MOUNTING

#### IV.2.1 - Number and position of the mounting points are not predetermined

In this case, the number and position of the mountings are determined in such a way that the load on each mounting is the same for all mounting points.

Taking, for example, a symmetrical machine with:

G: the centre of gravity

P: the weight of the machine

Calculate the position of 6 mounting points such that the load on all the mounting points is  $P_1$

$$P_1 l'_1 + P_1 l'_2 = P_1 l_1$$

$$\text{from which } l_1 = l'_1 + l'_2 \text{ and the load per point} = \frac{\text{Weight}}{6}$$

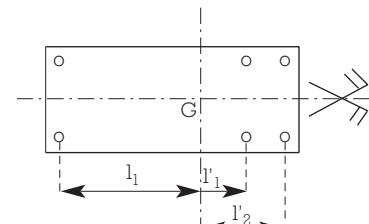

Fig. 13

#### IV.2.2 - Number and position of the mounting points are predetermined

In this case, it may not be possible to have the same load on each mounting.

##### • Four mounting points

A, B, C and D are the mounting points,

G the centre of gravity

P the total weight suspended

$P_A, P_B, P_C$  and  $P_D$  are the loads on the mounting points A, B, C and D.

$$P_A = \frac{m_2}{b} \cdot \frac{l_2}{a} \cdot P \quad P_B = \frac{m_1}{b} \cdot \frac{l_2}{a} \cdot P$$

$$P_C = \frac{m_1}{b} \cdot \frac{l_1}{a} \cdot P \quad P_D = \frac{m_2}{b} \cdot \frac{l_1}{a} \cdot P$$

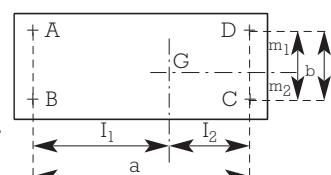

Fig. 14

If  $P_A, P_B, P_C$  and  $P_D$  are significantly different, it is, theoretically, necessary to choose four different mountings which will give the same deflection under the various loads.

### • More than four mounting points (fig. 15)

In this case it is best if the assembly is symmetrical about a vertical plane. This is assumed to be true in the following.

To the left of G, there are  $2n$  identical mountings.

To the right of G, there are  $2p$  identical mountings which are, possibly, different from the  $2n$  mountings to the left.

The problem is to set the difference between the left hand and right hand mountings so that the deflection under load of the  $2n + 2p$  mountings are all the same.

Under these conditions, all the mountings to the left of G will be supporting the same load Q and all those to the right will be supporting the same load R.

This will give:

$$Q(l_1 + l_2 + \dots + l_n) = (\lambda_1 + \lambda_2 + \dots + \lambda_p)P$$

$$2nQ + 2pR = P$$

From which the mountings charge is:

$$Q = \frac{\lambda_1 + \lambda_2 + \lambda_p}{2n(\lambda_1 + \lambda_2 + \dots + \lambda_p) + 2p(l_1 + l_2 + \dots + l_n)} \cdot P$$

$$R = \frac{l_1 + l_2 + l_n}{2n(\lambda_1 + \lambda_2 + \dots + \lambda_p) + 2p(l_1 + l_2 + \dots + l_n)} \cdot P$$

If Q and R are not too different, the same size mountings may be used but with different hardness elastomers.

Example (fig. 16)

Taking a symmetrical machine with an offset centre of gravity G and 6 mounting points

$n = 2$  et  $p = 1$ .

which gives:

$$Q = \frac{\lambda}{4\lambda + 2(l_1 + l_2)} \cdot P$$

$$R = \frac{l_1 + l_2}{4\lambda + 2(l_1 + l_2)} \cdot P$$

If the machine weighs 500 daN and  $\lambda = 0.4$  m;  $l_1 = 0.3$  m;  $l_2 = 0.9$  m, then  $Q = 50$  daN and  $R = 150$  daN.

### IV.2.3 - Important notes

If a single size of mounting is used, but different hardness elastomers are chosen, there is a high risk that the mountings may be interchanged which may degrade the attenuation of the suspension. The machine must be mounted with great care.

There are, however, benefits from using identical mountings to build a suspension. If the predetermined mounting points of the chassis do not allow a centered suspension, the solution is to attach these to a false chassis, as rigid as possible, to which the desired number of identical flexible mountings are attached in the positions required. If this false chassis is a slab of concrete (or inertia block) the suspended mass is increased which improves the quality of the suspension.

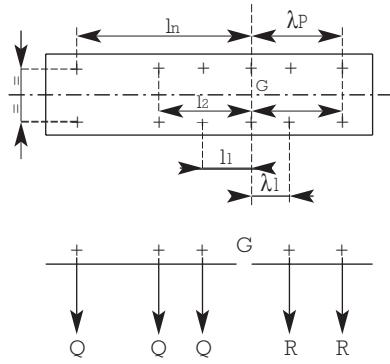

Fig. 15

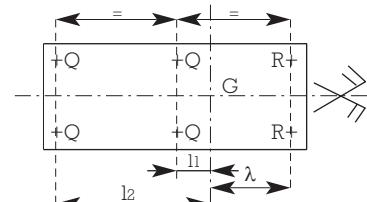

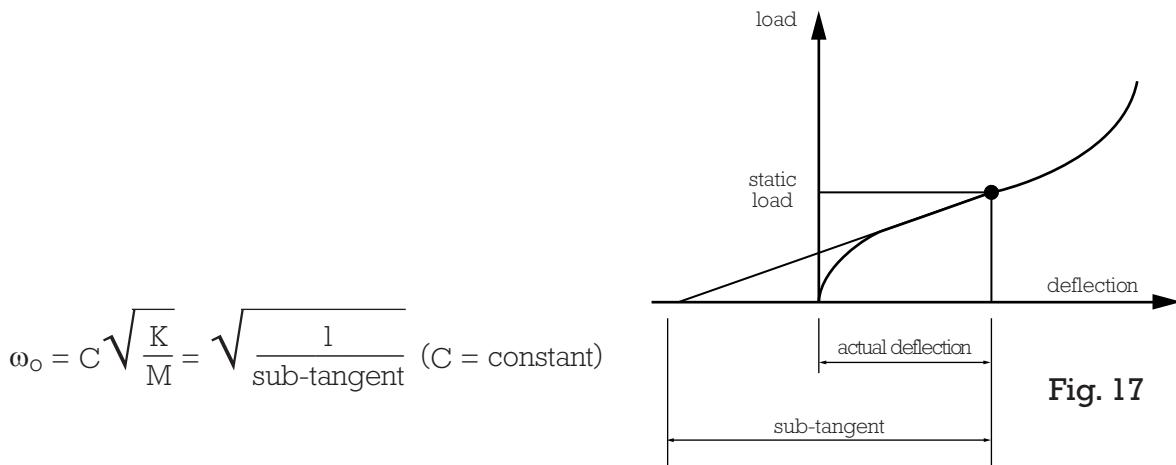

Fig. 16

## IV.3 - DETERMINING THE DEFLECTION

### IV.3.1 - Deflection and sub-tangent

Fig. 17 is a graphical representation of the derivation of the deflection and sub-tangent from the load/deflection curve.

For a given static load, the deflection corresponds to the compression of the mounting under that load, but the stiffness about the position under load is given by the sub-tangent (the projection of the tangent onto the axis). This is the elasticity which determines the natural frequency of the mounting.

For most PAULSTRA mountings, the load/deflection curve is linear in the region of static loads (fig. 18) and, as a result, the sub-tangent and the deflection are identical.

The curve in fig. 17 is typical of EVIDGOM mountings.

For these it is best to work at the point of inflection of the curve where the sub-tangent is the largest possible and so the natural frequency is as low as possible.

**The deflection does not indicate the amplitude of the oscillations of the machine.**

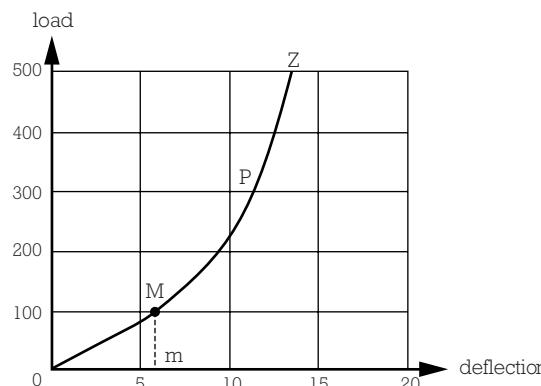

### IV.3.2 - Operating regions

The region OM is the static load region. The deflection is approximately proportional to the load.

**In the data sheets, the coordinates of the point M are given as the NOMINAL STATIC LOAD.**

The region MP is the dynamic load region corresponding to normal, repeated shocks provided that the rate and total deflection stay within normal limits.

In the region PZ, which corresponds to exceptional, accidental shocks, the curve rises rapidly. The stiffness increases progressively which has the effect of reducing the amplitude of the movement. Note that, because of the natural damping properties of the rubber, this increase also depends on the speed of impact.

**Fig. 18**

### IV.3.3 - Attenuation - Excitation frequency

At a given excitation frequency  $\omega$ , the attenuation depends on the natural frequency  $\omega_0$  and thus the sub-tangent.

With most rotating machines, the excitation frequency in cycles per minute can be taken to be the rotation speed in rpm.

As indicated on the chart (fig. 6, in § III.2.1.2) for a natural frequency in a known direction, the aim is to obtain the highest possible attenuation within the constraints of the load / deflection characteristics of the mountings.

The deflection selected must not be so high as to be detrimental to the stability of the suspension.

If the operating point is not within the vibration isolation zone, our Technical Services should be consulted.

### IV.3.4 - Static stiffness - Dynamic stiffness - Natural frequency

Whereas deflection and sub-tangent are given by the static stiffness curve of the mounting, its natural frequency is linked to the dynamic stiffness. In the case of elastomeric mountings, static and dynamic stiffness can be different.

The ratio between static and dynamic stiffness depends on the input amplitude, the frequency and the type of elastomer. Under nominal load, the natural frequency is given for indication only.

For a different load, the natural frequency could be found with the following formula:

$$F_p(\text{actual load}) = F_p(\text{nominal load}) \times \sqrt{\frac{\text{nominal load}}{\text{actual load}}}$$

This approximate is valid only if the actual load is in the linear part of the load/deflection curve (Fig. 17 & 18).

## IV.4 - DESIGN EXAMPLES

PAULSTRA mountings are classified according to their stiffness characteristics

Therefore, after having determined the number and deflection of the mountings as described above, the choice of mountings depends on the direction of the excitation.

- Equi-frequency mountings: the flexibility is approximately the same vertically as horizontally.
- Mountings with high axial flexibility: high axial flexibility while supporting radial loads.
- Mountings with high radial flexibility: high radial flexibility while supporting axial loads.
- Low frequency mountings: high sub-tangent to achieve a very low natural frequency (a few Hertz).

### IV.4.1 - Suspension for a fan

#### • Characteristics of the equipment:

- Weight: 3000 daN.
- Speed of rotation: 1200 rpm.
- Fan mounted on a 2.5 x 3 m chassis with no constraint on the position of the fixing points.
- Known centre of gravity.

Number of mountings: after trials, using successive approximation to balance the moments of inertia, 12 mounting points were selected.

Load per mounting =  $3000/12 = 250$  daN.

Natural frequency of the mounts (see chart).

For an input frequency (or speed of rotation) of 1200 rpm, the maximum natural frequency is 14 Hz. A natural frequency of 7 Hz will achieve a reasonable attenuation of about 85%.

Therefore, a mounting with a natural frequency of 7 Hz under 250 daN is required.

As it is a rotating machine with no special characteristics, isometric mountings are selected.

The selection guide gives a PAULSTRADYN mounting with a 8 mm deflection under a 260 daN load. According to the data sheet for PAULSTRADYN mountings, the PAULSTRADYN Ø 100 hardness 60 has a deflection of 7.4 mm under a load of 240 daN, which is just right.

#### • Suspension characteristics:

- 12 PAULSTRADYN 260. Mountings part number 533712.
- Ratio  $\frac{\text{Real load}}{\text{Nominal load}} = \frac{250}{260} = 0.96$
- Attenuation  $\simeq 85\%$ .
- Loaded height  $\simeq 32.5$  mm\*.

\* These values are given by the Paulstradyn data sheet.

## IV.4.2 - Suspension of an engine/hydraulic pump unit mounted on an excavator

### • Characteristics of the assembly:

- Weight: 1200 daN.
- Speed of rotation: 1500 rpm.
- Known centre of gravity.
- 6 mounting points.

Load per mounting:  $1200/6 = 200$  daN.

Deflection (see chart, fig. 5).

For a frequency of 1500 rpm, a deflection of **3 mm** will achieve an attenuation of approximately 85%.

The vibrations are predominantly vertical and the unit needs to be restrained laterally to cope with the movement of the excavator in operation. Mountings with dominant axial flexibility are selected.

The PAULSTRA mounting selection guide gives a STABIFLEX mounting with a deflection of 5 mm for a load of 210 daN. According to the STABIFLEX mounting data sheet, the mounting required is a STABIFLEX 530622 hardness 45 with a square base.

### • Suspension characteristics (under 1200 daN at 1500 rpm):

- 6 STABIFLEX mountings reference 530622 hardness 45.
- Deflection 4.7 mm.
- Theoretical attenuation 85% (16 dB).

## IV.4.3 - Suspension of a sieve

### • Characteristics of the equipment:

- Weight: 400 daN.
- Vibration frequency (horizontal): 1200 cycles/mn or 20 Hz.
- Known centre of gravity.
- 6 mounting points.

Load per mounting:  $400/6 = 66$  daN.

Deflection (see chart, fig. 5).

For a frequency of 20 Hz, a deflection of **6 mm** will achieve an attenuation of approximately 70%.

Mounting characteristics required:

- 1) mountings which will withstand the vertical load;
- 2) mountings with a radial flexibility very much greater than the axial flexibility (mounting with dominant radial flexibility);
- 3) providing vibration isolation vertically (axially), which, taking account of requirement (2), will assure the horizontal vibration isolation.

The PAULSTRA mounting selection guide gives a RADIAFLEX cylindrical stud giving a deflection of 8 mm for a load of 70 daN.

According to the RADIAFLEX mounting data sheet, the mounting required is a stud Ø 30 height 30 mm with 2 mounting bolts (ref. 521312).

The radial flexibility (shear) is considerably higher than axial flexibility (compression).

### • Suspension characteristics:

- 6 RADIAFLEX cylindrical mounts with 2 screws reference 521312 (theoretical vibration attenuation: 80% - 14 dB).

## IV.4.4 - Suspension of a compressor unit

### • Characteristics of the assembly:

- Weight: 6000 daN.
- Speed of rotation: 400 rpm.
- Known centre of gravity.
- 8 mounting points.
- Load per mounting:  $6000/8 = 750$  daN.

### • Deflection of mountings:

For a frequency of 400 rpm, the minimum deflection to be within the vibration isolation region is 12 mm. The PAULSTRÄ mounting selection guide gives a low frequency mounting which can provide sufficiently large deflections (26 mm).

According to the EVIDGOM mounting data sheet, the mounting required is an EVIDGOM mounting Ø 125, height 140 mm, reference 810784 which gives a deflection of 26 mm under a load of 800 daN.

### • Suspension characteristics:

- 8 EVIDGOM mountings reference 810784, Ø 125 mm, height 140 mm.
- Deflection 26 mm.
- Attenuation 37% (4 dB).

**Note:** as the low frequency mountings are tall, for some applications (sideways forces) it may be necessary to provide lateral stops.

## IV.4.5 - Suspension from a ceiling (false ceiling, ventilation units, pipework)

- *For light loads of 15 to 135 kg per item our TRAXIFLEX mountings may be used directly.*

Example of use:

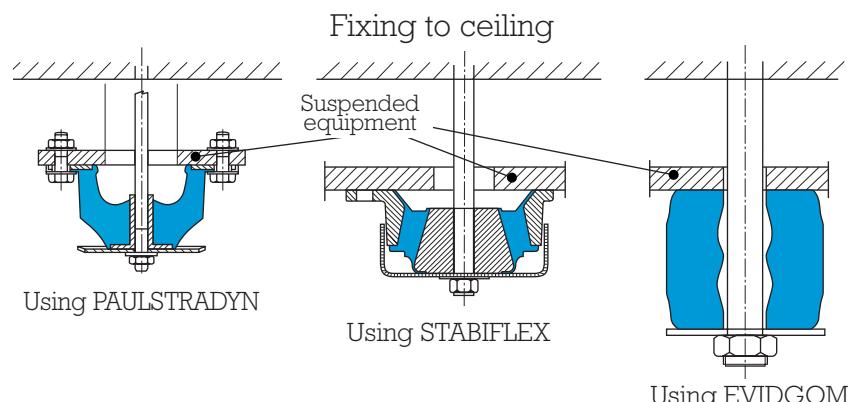

False ceiling - load per mounting 50 kg - frequency of excitation 25 Hz - mounting selected 535611 hardness 45 - deflection under load 4 mm - theoretical vibration attenuation 77% - 13 dB.

- *For heavy loads, it is necessary to use a PAULSTRADYN, STABIFLEX or EVIDGOM mounting with a safety fixing.*

Example of use:

1. Suspending a ventilation unit - weight 1000 daN - frequency 25 Hz - 4 PAULSTRADYN mountings Ø 200 reference 533718 - natural frequency  $\approx 7$  Hz - theoretical vibration attenuation 90% - 20 dB.
2. Suspending a special 5 tonnes machine requiring accurate radial positioning - frequency 20 Hz - 4 STABIFLEX mountings reference 530652 hardness 60 - deflection under load 8 mm - theoretical vibration attenuation 84% - 16 dB.
3. Suspending a 20 tonnes tank subject to longitudinal expansion - frequency 15 Hz - 4 EVIDGOM mountings reference 810733 hardness 60 - deflection under load 50 mm - theoretical vibration attenuation 95% - 26 dB.

In general:

For fixed installations: RADIAFLEX, PAULSTRADYN and BECA.

For mobile installations: STABIFLEX, S.C., S.T.C.

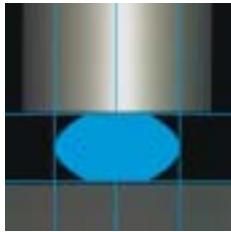

Avoid using the mount with the rubber to metal bond area in tension.  
These mounts should only be used in compression or shear.

Admissible application

# RADIAFLEX

## DESCRIPTION

- Metalwork: mild steel, plated.
- Natural rubber, bonded, cylindrically shaped.
- Welded fixings: 5 styles (single side threaded stud, single side threaded hole, double threaded studs, double threaded holes, combination fixing).

In Europe, we often use different screw standards than our french standard.

To better satisfy this need, Paulstra has created a new range Radiaflex Europe.

This range is available with the 4 usual welded fixings and with a new fixing: **the threaded hole stop**.

## CHARACTERISTICS

The design of the RADIAFLEX mount gives the following basic characteristics:

- Radial elasticity greater than axial elasticity.
- The rubber works in:
  - compression (axial).
  - shear (radial).
  - compression/shear according to the fixing method.

### Advantages:

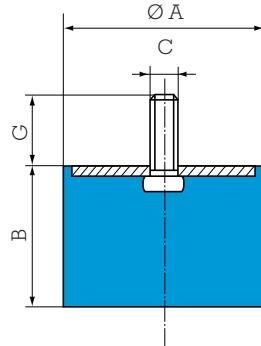

- Simple to fix.
- Simple and economical.
- Extensive range:
  - 13 stud diameters.
  - Several heights for each diameter.
  - 5 methods of fixing.

### Recommendations:

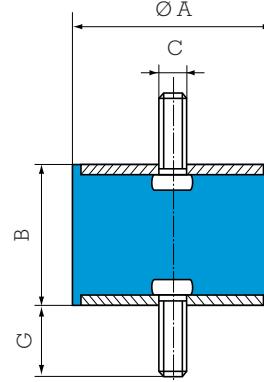

- Operation in shear is very useful for vibration isolation provided that the radial forces are not too great.

\* Shear characteristics' are measured under axial load.

Also available with Ø 30 locators on each end, 3 mm thick allow M14 threaded holes:

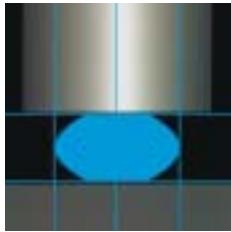

Ø A mm	B mm	C	Depth of thread mm	S cm²	Compression		Shear*		Ref.
					Max Load daN	Deflec- tion mm	Max Load daN	Deflec- tion mm	
80	60	M14	15.5	38.5	250	5	70	8	521802

## ASSEMBLY

The fixing holes for the Radiaflex mounts should have a chamfer with a depth equal to the pitch of the thread.

Ex. 521401: M10 x 150 chamfer = 1.5 mm  
521951: M16 x 200 chamfer = 2 mm

# PAULSTRADYN®

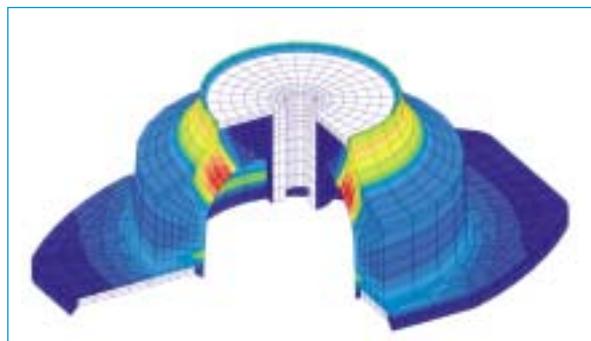

Natural frequency:

- axial 7 Hz
- radial 3 to 5.5 Hz

## ADVANTAGES

- Better than 90% isolation at 1.500 rpm (25 Hz).
- Constant height over wide load range.
- Stabilised characteristics during Service Life.
- Simple to fit.
- 400 hours protection against salt spray\*.
- Design.

\* When mounted according to the recommendations given in the catalogue.

Finite element modeling

### New formula SILTECH

- Low increase of stiffness with frequency
- Low creep

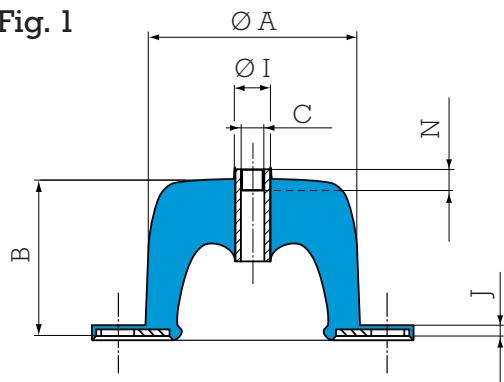

## APPLICATIONS

Antivibration isolation for static equipment:

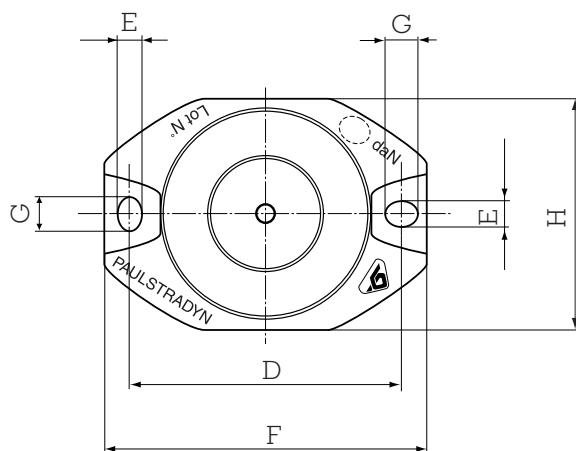

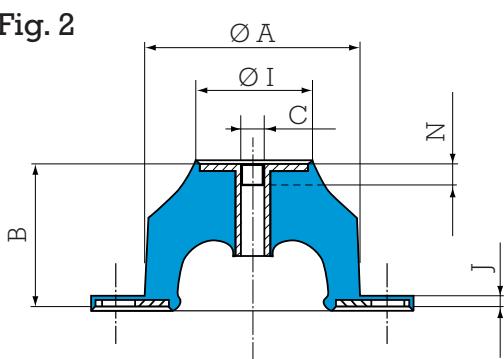

- rotating machinery such as fans, air-conditioning, pumps, compressors, generator sets.
- pipeworks, ceilings, transformers, electrical enclosures.

\* Height, unloaded 40 mm, under load 32 mm (see Technical Characteristics).

NL: Nominal static load with mounting under axial compression.

1 kg ≈ 1 daN

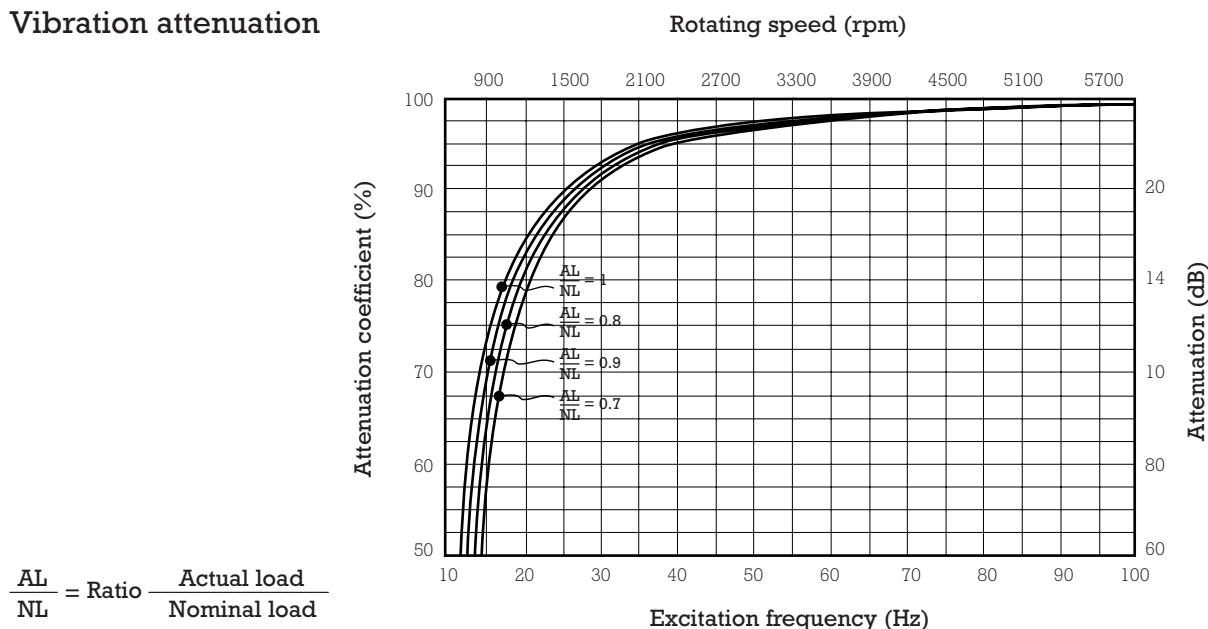

# TECHNICAL CHARACTERISTICS

The vibration attenuation and height characteristics under nominal loads are **stabilised after one month under a load at 20°C**.

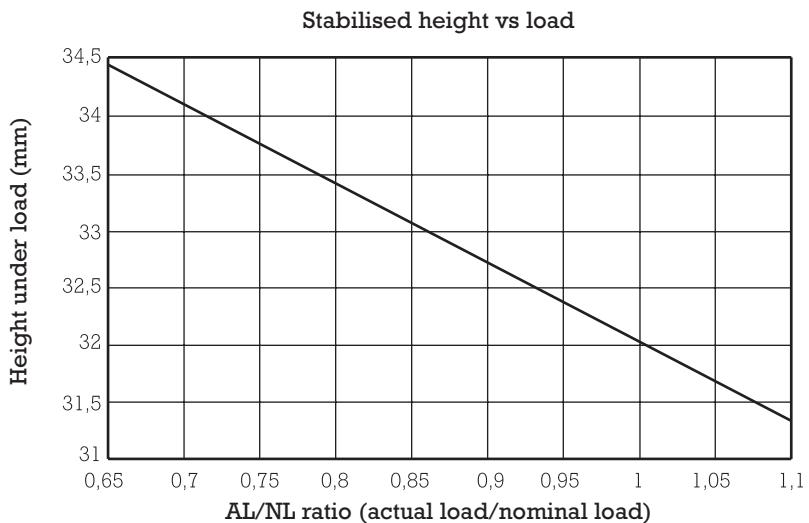

## Common characteristics

- Natural axial frequency: 7 Hz, with nominal load.
- Natural radial frequency: 3 to 5.5 Hz.
- Maximum displacement:
  - axial: 12 mm.
  - radial:  $\pm$  10 mm.

## Vibration attenuation

## Height under load

## Temperature

Operating temperature: - 20°C to + 70°C

## Other characteristics\*

- Good dynamic performance at high frequency.
- Withstand fatigue and shocks.
- Reduced creep.

\* Detailed Technical Characteristics can be sent on request. Ask us for details.

# MOUNTING

## Standard mounting

- ① machine base or foot  
dimensions >  $\varnothing M^*$
- ② supporting structure (floor)  
dimensions > base of mounting F x H\* (refer page 39)
- ③ screw  $\varnothing C^{**}$
- ④ screw  $\varnothing K$ , a washer is required between the screw head and the PAULSTRADYN\*\*3
- ⑤ screw  $\varnothing K$ , a washer is required between the screw head and the PAULSTRADYN\*\*3

Note: \* to distribute the load and resist corrosion

\*\* nuts and screws grade 4.6 minimum.

# STABIFLEX

(1) Natural frequency:  
6 to 11 Hz

## DESCRIPTION

The STABIFLEX mounting comprises a conical rubber section bonded between inner and outer metal parts.

- Centre axis with threaded hole.
- Square (4 holes) or diamond base (2 holes) with clearance hole.
- Bonded natural rubber, anti-slip bead.
- Cup to protect the rubber and distribute the load.

## OPERATION

The design of the STABIFLEX mounting gives the following basic characteristics:

- Axial elasticity two or three times higher than radial elasticity.
- The rubber works in shear/compression.
- Progressive buffer against shocks or accidental overload.
- Anti-slip (may be placed directly on the ground).

### Advantages:

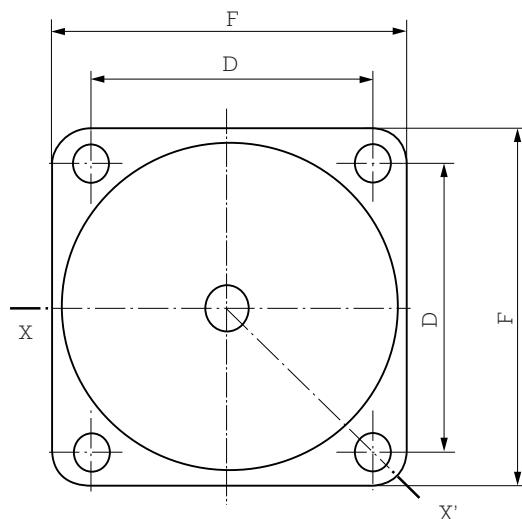

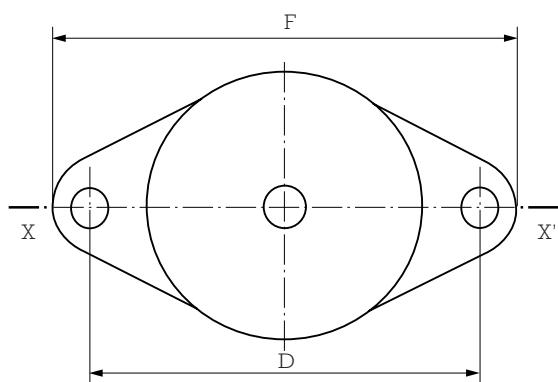

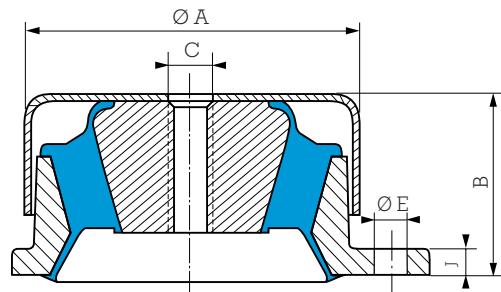

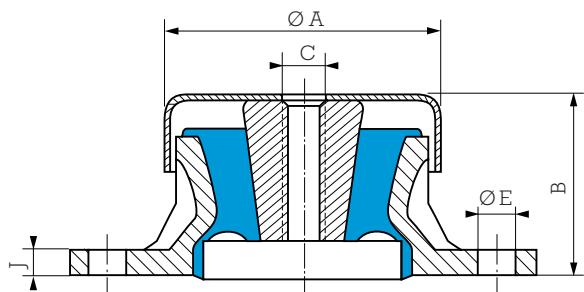

- The machine may be placed with its mountings directly on the ground.
- Speed of fixing.
- Easy movement of suspended machinery.
- Rubber protected against harmful liquids.
- Extensive range: 3 hardnesses of rubber for 5 existing types, allowing the mounting to be optimised as a function of the load and forcing frequency.
- May be used with an anti-rebound washer.

### Recommendations:

- In order not to affect the performances of the mounting system, all external connections must be flexible.
- STABIFLEX mountings must be fitted so that the vibration input is in the axial direction.

(1) Natural frequencies with max/min loads, see: OPERATING CHARACTERISTICS.

## DIMENSIONS

**STABIFLEX - diamond base**

**STABIFLEX - square base**

Type	Reference	Hardness	Ø A mm	B mm	C	D mm	E mm	F mm	J mm	Weight g

1 kg ≈ 1 daN

## LOAD/DEFLECTION CURVES IN AXIAL COMPRESSION

## ASSEMBLY

- Standard fixing methods

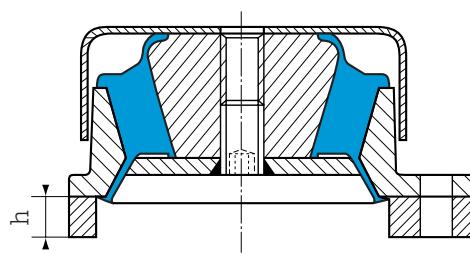

- Fixing with anti-rebound washer

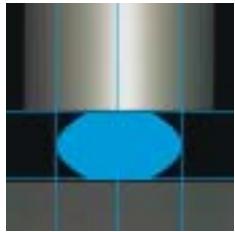

- The anti-rebound washer (not supplied) is fixed to the lower side of the centre axis.
- In this case, do not forget to fit a spacer.

Spacer thickness required:

530603	h: 2 mm
530613	h: 4 mm
530622	h: 7 mm
530642	h: 14 mm
530652	h: 14 mm

All our mountings are identified by conventional markings, either a paint spot or figures indicating the hardness: grey = hardness 45, green = hardness 60, blue = hardness 75.

# STABIFIX®

## STABIFIX® AR

(1) Natural frequency:  
7 to 12 Hz

## DESCRIPTION

The STABIFIX and STABIFIX AR (anti-rebound) are made of a rubber ring bonded to two metal shelves. The anti-rebound function is integrated with the STABIFIX AR version.

- Upper part with a smooth or a threaded hole (depending on version).
- Diamond base (2 holes) or square base (4 holes) for the lower fixing (2 holes).
- Natural rubber bonded.

## OPERATION

The design of STABIFIX gives the following basic characteristics:

- Axial elasticity greater than radial elasticity.
- The rubber works in compression/shear.
- Progressive buffer against shocks or accidental overload.

### Advantages:

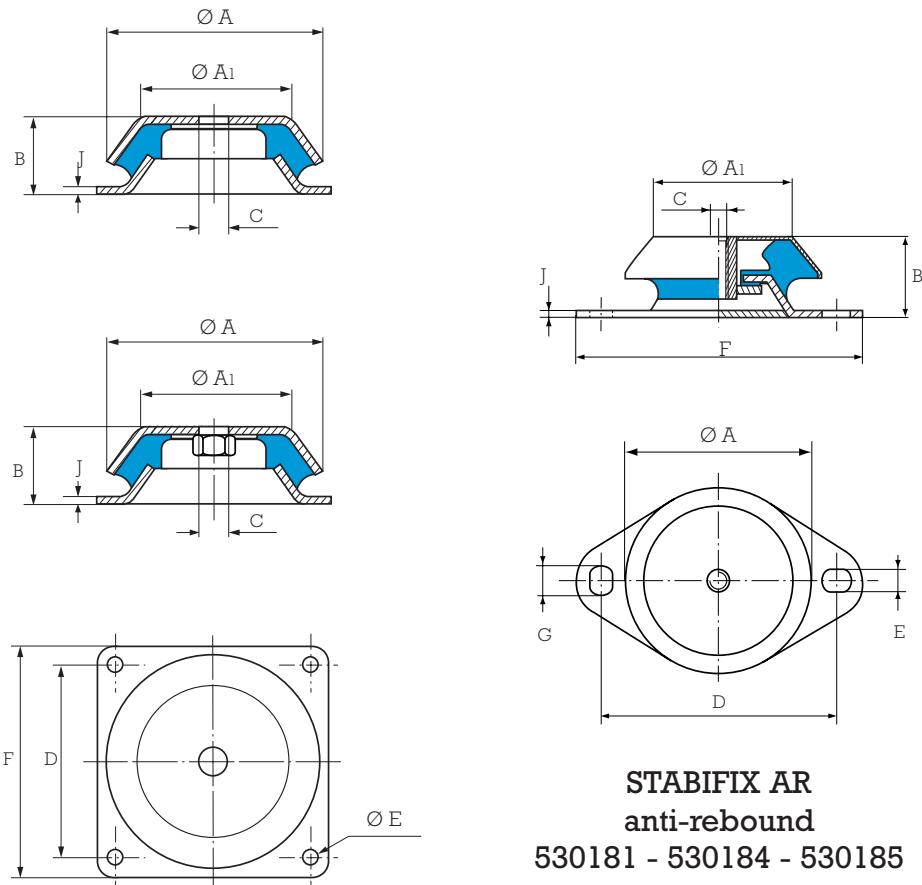

- Speed of fixing.
- Easy movement of suspended machinery.
- Rubber protected against harmful fluids.
- Extensive range: 3 hardnesses of rubber allow the mounting to be optimised as a function of the load and input frequency.

### Recommendations:

- In order not to affect the performances of the mounting system, all external connections must be flexible.
- STABIFIX and STABIFIX AR (anti-rebound) mountings must be fitted so that the vibration input is in the axial direction.

(1) Natural frequencies with max/min loads, see: OPERATING CHARACTERISTICS.

## DIMENSIONS

1 kg = 1 daN

All our mountings are identified by conventional marking indicating the hardness.

# S.C. MOUNTING

(1) Natural frequency:  
6 to 30 Hz

## DESCRIPTION

The S.C. mounting comprises an annular section bonded between the inner tube and outer housing.

The outer housing has a mounting flange (4 different types).

## OPERATION

The design of the S.C. mounting gives the following basic characteristics:

- Axial elasticity four times higher than radial elasticity.
- The rubber works in shear.
- Progressive buffer against shocks or accidental overload, provided that a large metal washer is used to bear against the rubber dome.
- Can be used as a fail safe assembly when fitted as in figure 1.

### Advantages:

- Extensive range: 3 hardnesses of rubber for 20 existing types, allowing the mounting to be optimised as a function of the load and exciting frequency.

### Recommendations:

- In order not to affect the performance of the mounting system, all external connections must be flexible.
- S.C. mountings must be fitted so that the vibration input is in the axial direction.

(1) Natural frequencies with max/min loads, see: OPERATING CHARACTERISTICS.

## LOAD/DEFLECTION CURVES IN AXIAL COMPRESSION

## ASSEMBLY

### • Standard fixing

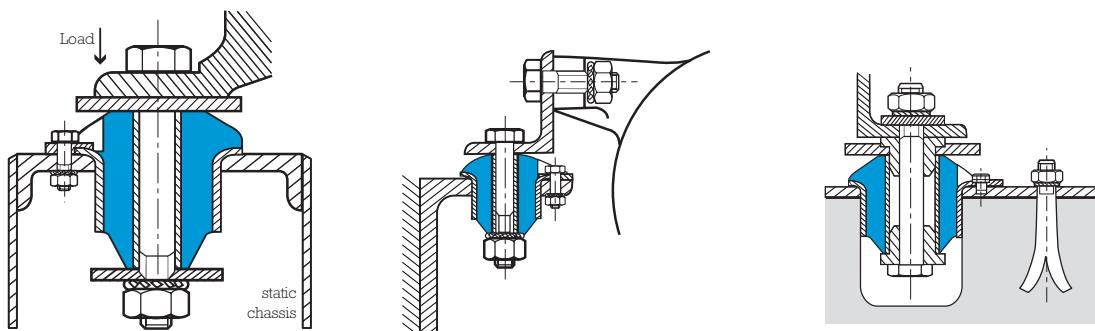

Fig. 1 - Fixing between the equipment and a metallic chassis (failsafe in mobile applications).

Fig. 2 - Fixing between two brackets onto a vertical surface (non failsafe).

Fig. 3 - Fixing between the equipment and concrete (using locating rings).

### • Reversed fixing

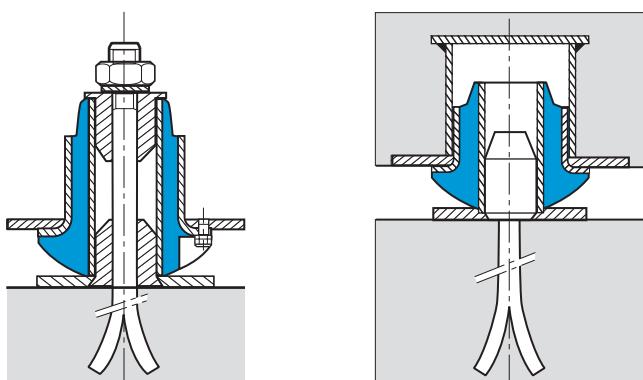

Fig. 4

Fig. 5 - Fixing between inertia base and foundation. The inertia base increases the suspended mass and thus reduces the amplitudes of the vibrations as well as lowering the natural frequency.

### • Mounting in tandem

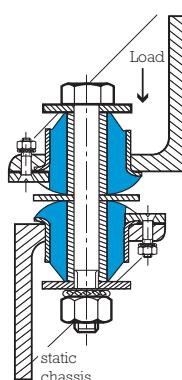

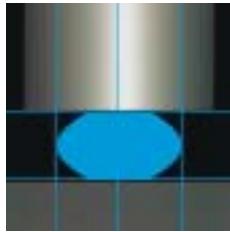

Fig. 6 - Two mountings fixed face to face. Provides twice the deflection under the same load.

# EVIDGOM®

(1) Natural frequency:  
2.5 to 7 Hz

## DESCRIPTION

The EVIDGOM mounting is formed from two thick conical membranes, joined at their bases to create a highly elastic mounting. There are three variations:

- All rubber EVIDGOM.
- EVIDGOM with bonded fixing.
- EVIDGOM with a diamond or square mounting plate (fixing plate supplied as a separate kit).

## OPERATION

The design of the EVIDGOM mounting gives the following basic characteristics:

- A very high axial elasticity.
- Very low natural frequency (a few Hertz).
- Progressive buffer against shocks or accidental overload.

### Advantages:

- As the load/deflection curve has a point of inflection, a suspension may be designed to have a sub-tangent greater than the static deflection.
- The elastomer used provides intrinsic damping with a corresponding ability to absorb energy which gives appreciable advantages over metallic springs.

### Recommendations:

- The selection of a low natural frequency (large deflection) must not be allowed to endanger the stability of the suspension (tall equipment).
- In certain cases (use under maximum load) the use of side stops is recommended.

(1) Natural frequencies with max/min loads, see: OPERATING CHARACTERISTICS.

## LOAD/DEFLECTION CURVES IN AXIAL COMPRESSION

## S.T.C.

(1) Natural frequency:  
10 to 25 Hz

## DESCRIPTION

The S.T.C. mounting comprises a rubber ring bonded to a central tube.

- Inner tube: mild steel.
- Bonded rubber in the form of a ring at the top with a collar below which is used for fixing.

## OPERATION

The design of the S.T.C. mounting gives the following basic characteristics:

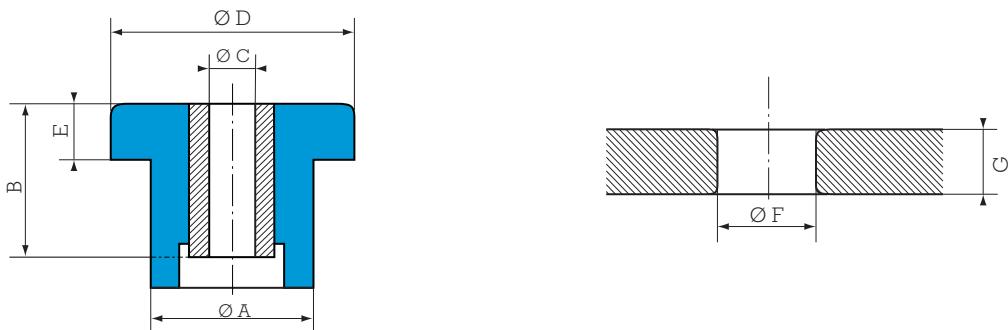

- The rubber works in compression.
- Anti-rebound.
- Can be used as safety mounting.

### Advantages:

- Simple to fix.
- Simple and economical.
- Extensive range of loads.

(1) Natural frequencies with max/min loads, see: OPERATING CHARACTERISTICS.

# STOPS

See: Supports and  
Bump stops

Cylindrical stop   Conical progressive stop

LEVAFLEX progressive stop

EVIDGOM stop

## DESCRIPTION

There are several types of stops:

- Cylindrical or DIABOLO stops.
- Conical progressive stops.
- LEVAFLEX progressive stops with central cavity.
- EVIDGOM stops.

## OPERATION

The design of the PAULSTRA elastic stops gives the following basic characteristics:

- Highly deformable allowing high energies to be absorbed.
- Progressive absorption of energy due to the carefully designed shape.

### Advantages:

- By comparison with rigid stops, PAULSTRA elastic stops are quiet and avoid hammering and deterioration of equipment.

### Recommendations:

- The stops must be fitted so that, on impact, the axis of the stop is perpendicular to the contact surface.
- On impact, the external diameter of the stop increases: this must be allowed for when fixing.

LEVAFLEX AND EVIDGOM STOPS** (Pages 61 and 62)

# NIVOFIX®

See Vibrachoc  
metallic range:  
V43 - V44 - V45 - V46

## DESCRIPTION

The NIVOFIX mounting is an adjustable equipment foot comprising a circular disc bonded to a protected elastomer base. An adjustment screw permits the levelling.

The elastomer base has anti-slip ridges.

## OPERATION

The design of the NIVOFIX mounting gives the following basic characteristics:

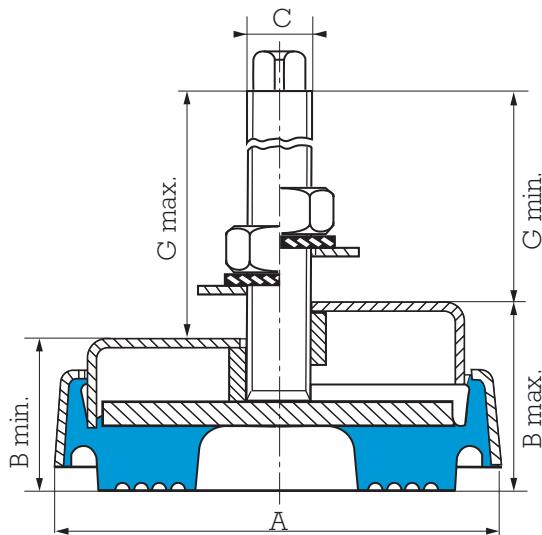

- Accurate adjustment of the mounting to correct the equipment's seating (adjustment screw, correction of altitude).
- Absorbs high frequency vibrations.
- Corrosion resistant (nitrile elastomer, protective shroud, galvanised metallic parts).
- Anti-slip sole (no need to fix).

### Advantages:

- Speed of fixing.
- Simple removal of the equipment.
- No shimming.

## DIMENSIONS

## APPLICATIONS

NIVOFIX mountings are used for all equipment requiring height adjustment.

Equipment already using NIVOFIX mountings:

- Vertical mill
- Mortiser
- Multichuck drill
- Sheet metal bender
- Polisher
- Press
- Plane
- Horizontal mill
- Lathe
- Office equipment
  - accounting
  - computing
- Packaging machine
- Test equipment
- Printing press
- Gear cutter
- Textile machinery

# MINIFIX

New range  
MINIFIX

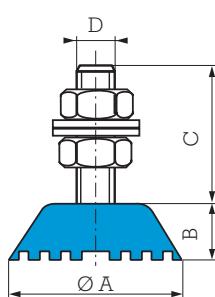

## DESCRIPTION

The MINIFIX mounting comprises an elastomer pad with an anti-slip ridged surface and a threaded stud allowing accurate height adjustment of equipment.

Made in two hardnesses (50 and 80 Sh) the MINIFIX mounting is perfectly suited to a variety of applications and is delivered complete with fixing nuts and washers. MINIFIX mounting nuts and screws are made of steel or stainless steel.

## CHARACTERISTICS

Reference Stainl. steel	Reference Steel	Hardness	Colour	Ø A mm	B mm	C mm	D	Load range daN

\* Threaded centre hole.  
See current price list for availability of items.

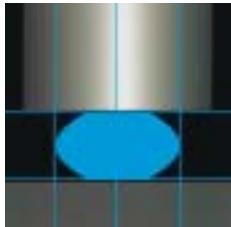

1 kg ≈ 1 daN

## APPLICATIONS

Simple and economic, MINIFIX mountings are particularly suitable for the installation of equipment such as:

- Electrical or electronic enclosures.
- Packaging equipment.
- Test and measuring equipment.
- Equipment for the food industry.
- Laboratory equipment.
- Household appliances.

# TRAXIFLEX

(1) Natural frequency:  
8 to 10 Hz

See Vibrachoc  
metallic range:  
VE101 - VE111  
VE112 - VE113

## DESCRIPTION

The TRAXIFLEX mounting comprises two metallic U armatures joined by two bonded rubber blocks.

It is available in two versions: male/female and female/female.

## OPERATION

The design of the TRAXIFLEX mounting gives the following basic characteristics:

- Rubber works in compression-shear.
- The same deflection under nominal load for all types.
- Safety system in case of elastomer failure.

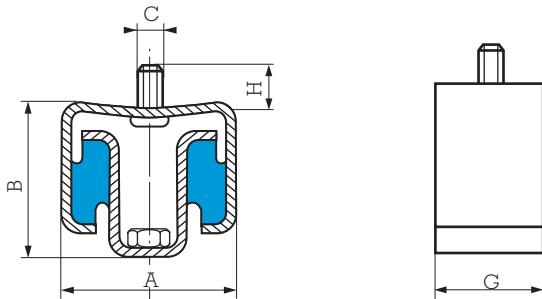

### Advantages:

- Economic solution for suppressing structure borne noise.
- Several fixing methods.
- High resistance to atmospheric exposure:
  - galvanised armatures
  - chloroprene elastomer.
- Upper metallic part is shaped to simplify orientation while fixing.
- Two hardnesses of elastomer to extend the choice of mounting as a function of load.
- Filtration of vibration and the attenuation of the consequent noise.
- Allows movement due to thermal expansion.

(1) Natural frequencies with max/min loads, see: OPERATING CHARACTERISTICS.

1 kg ≈ 1 daN

TRAXIFLEX mountings have been subjected to acoustic trials at the Centre Expérimental de Recherches et d'Études du Bâtiment et des Travaux Publics which has given the PV nr. 554.6.078.

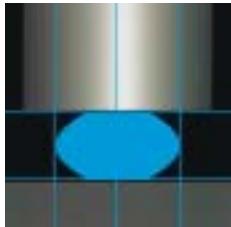

**Note:** For important loads, refer to solutions given page 26.\*\* Elastomer resistant to fire M1 (Suffix 11).

## ASSEMBLY

When fixing, ensure that all the TRAXIFLEX mountings are supporting the same load. It is necessary to ensure that they are all the same distance from the fixing surface (ceiling, girder, plank...).

TRAXIFLEX mountings can be used to suspend pipework: the whole assembly being fixed to the ceiling.

- Suspending hot air ducts.
- Suspending a fan unit and distribution ducts.
- Suspending a hot air generator with continuous airflow.
- Suspending an integral cased air conditioner.

# BATRA RING

(1) Natural frequency:  
7 to 22 Hz

## DESCRIPTION

The BATRA ring comprises a rubber ring bonded to two metallic washers one with a circular groove, the other with a mating circular ridge which allows BATRA rings to be mounted one on top of another.

## OPERATION

The design of the BATRA ring gives the following basic characteristics:

- Behaviour identical to that of a metallic spring plus damper.
- Robustness:
  - well behaved under shock.
  - removal of the risks of suspension collapse.
- Flexibility easily tailored by stacking BATRA rings.
- Transverse creep limited by the two bonded armatures.

## APPLICATIONS

BATRA rings may be used:

- For making suspensions that are very flexible vertically and also damped by the natural properties of the rubber (road and rail vehicles).
- For making very effective anti-shock buffers (wagons, cars, gantries).

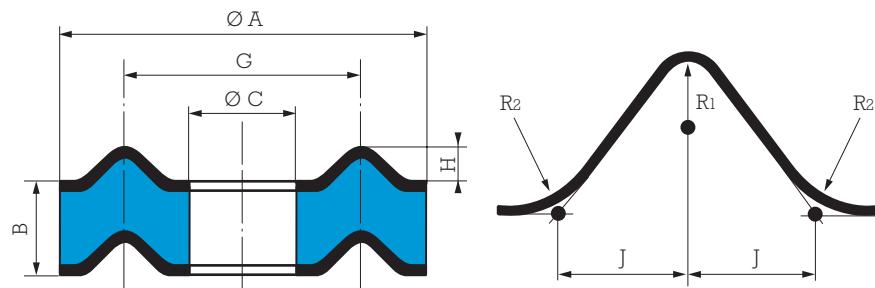

For special applications, where the quantities would justify custom manufacture, it is possible to supply Special BATRA rings either with only one bonded lower armature or "all rubber".

For special cases of shock, there are Special BATRA rings with overlapping, non-bonded, armatures.

(1) Natural frequencies with max/min loads, see: OPERATING CHARACTERISTICS.

1125-4500	5.5	13500	13	282	541250

(1) The instantaneous deflection indicated in this table is approximate as it depends on the impact speed.  
It is possible to use a metallic cushion for this application.

1 kg ≈ 1 daN

## ASSEMBLY

The rings are centred using the grooves and ridges. To avoid play under no-load conditions, the stack should be pre-compressed by 3 to 10% of its height. It is also necessary to leave sufficient room around the stack for the sideways expansion under load.

# BECA

(1) Natural frequency:  
8 to 14 Hz

## DESCRIPTION

The BECA mounting comprises one piece elastomer bonded to a top and bottom plate.

- Top plate: smooth or threaded (welded nut) hole.
- Bottom plate: fixing lugs or direct bearing on the ground.
- Bonded rubber.
- Domed rubber ring.
- Anti-slip bead or grooved anti-slip sole.
- Removable protective top cover: protects the rubber and distributes the load.

## OPERATION

The design of the BECA mounting gives the following basic characteristics:

- Transverse elasticity approximately the same as the axial elasticity (eiquifrequency).
- Rubber works in compression.
- Progressive buffer against shocks or accidental overload.
- Anti-slip (may be placed directly on the ground).

### Advantages:

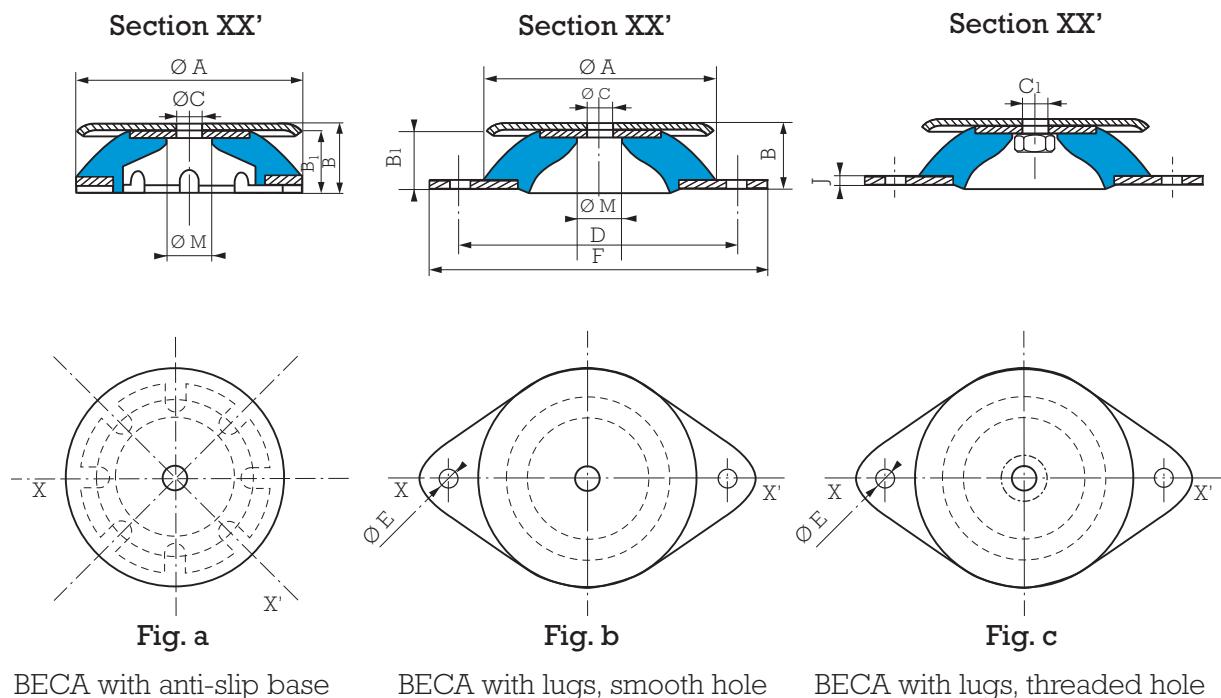

- The machine may be placed (with its mountings) directly on the ground.
- Very slim.
- Speed of fixing.
- Simple removal of the assembly.
- Extensive range: 3 hardnesses of rubber for 6 existing sizes, allowing the mounting to be optimised as a function of the load and stimulation frequency.
- A choice of 3 fixing styles.

### Recommendations:

- In order not to affect the suspension of the machine, all external connections must be flexible.
- BECA mountings can be used for fixed, well-balanced rotating machinery, otherwise a ballasting slab should be used.

(1) Natural frequencies with max/min loads, see: OPERATING CHARACTERISTICS.  
**Nota:** BECA mountings can be replaced by PAULSTRADYN mountings.

# ISOFLEX

(1) Natural frequency:  
11 to 15 Hz

## DESCRIPTION

The ISOFLEX mounting comprises two concentric metallic parts joined by a bonded, perforated rubber ring.

## OPERATION

The design of the ISOFLEX mounting gives the following basic characteristics:

- Elasticity approximately the same in all directions (equi-frequent mounting).

## APPLICATIONS

ISOFLEX mountings may be used for suspending any small measuring or recording equipment, mobile equipment, machine tool controls.

(1) Natural frequencies with max/min loads, see: OPERATING CHARACTERISTICS.

## DIMENSIONS

1 kg ≈ 1 daN

All our mountings are identified by conventional markings, either a paint spot or figures indicating the hardness:

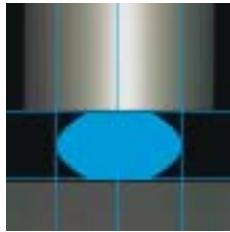

grey = hardness 45, green = hardness 60, blue = hardness 75.

## ASSEMBLY

To avoid toppling or canting, the suspension should be designed so that the centre of gravity of the suspended equipment is close to the geometrical centre of the suspension.

Fixing method

# ISODYNE

## DESCRIPTION

The ISODYNE mounting comprises two half mountings joined together.

## OPERATION

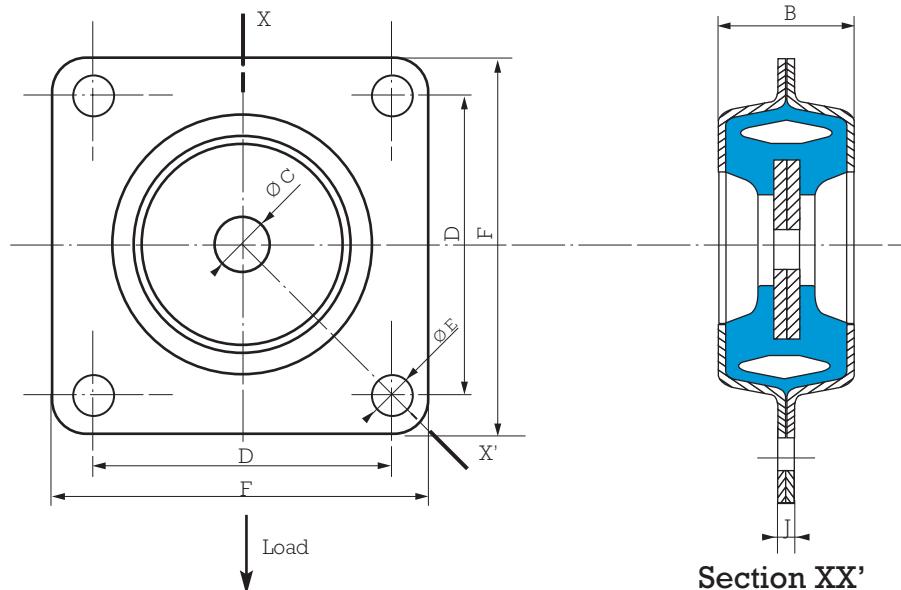

The design of the ISODYNE mounting gives the following basic characteristics:

- A very high axial to radial stiffness ratio.
- Vertical fixing avoiding excessive inclination of the equipment.
- Fixing at any angle.
- Safe, anti-rebound.

## APPLICATIONS

ISODYNE can be used to suspend lightweight equipment in a vertical plane.

## SILICONE RUBBER / SPECIAL ELECTRONICS

### SMALL LOADS / HIGH DEFLECTIONS

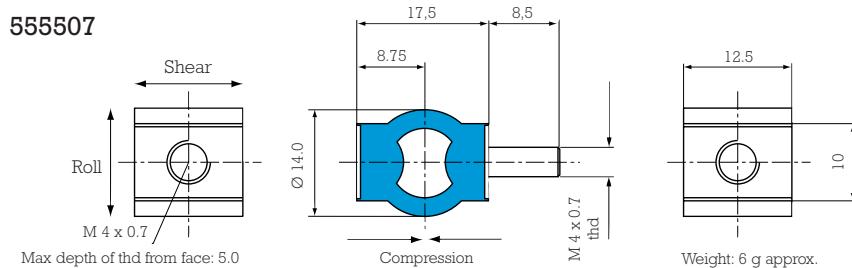

#### DESCRIPTION

Low frequency high deflection antivibration mounting available in a choice of elastomers including high damped silicone. The zinc plated mild steel metalwork is fully bonded for improved fatigue strength.

#### APPLICATIONS

These mounts have been designed to protect low mass components and instruments from vibration and shock and to isolate small rotating machines e.g. pumps and electric motors.

#### DIMENSIONS

#### OPERATING CHARACTERISTICS

- Maximum sinusoidal input at resonance:  $\pm 0.5$  mm.  
Resonance frequencies at maximum input: 10 to 25 Hz dependent on axis and load.  
Axial to radial stiffness: 3 : 1.  
Amplification at resonance: silicone mounting: 4 rubber mounting: 10.  
Maximum displacement during shock: axial: 5 mm.  
radial: 7 mm.

Mechanical strength corresponding to a continuous acceleration of 10 g at maximum load.

**NB:** The \* define the type of fixing: combination fixing: 555007 male/male fixing: 555005 female/female fixing: 555006

#### ASSEMBLY

Improved stability can be achieved if the mounts are inclined at 45° towards the centre of gravity.

# “SANDWICH” MOUNTING

(1) Natural frequency:  
5 to 13 Hz

## DESCRIPTION

The SANDWICH mounting comprises one or more layers of elastomer bonded to flat, parallel metallic plates. These mountings may be cylindrical or rectangular. They are designed to withstand very high compressive loads. The range of mechanical characteristics is governed by the hardness of the rubber and the number of intermediate metallic plates.

These mountings can support compression from 20 to 100 bars.

The metal plates usually receive a phosphate anti-corrosion treatment.

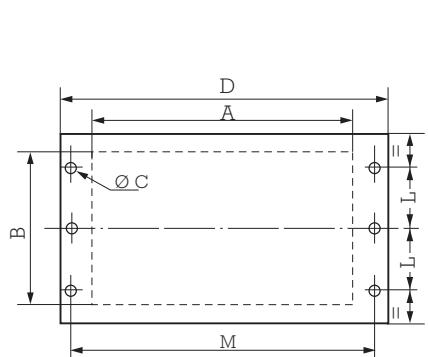

The elastomer is polychloroprene which provides a high resistance to atmospheric exposure.

## OPERATION

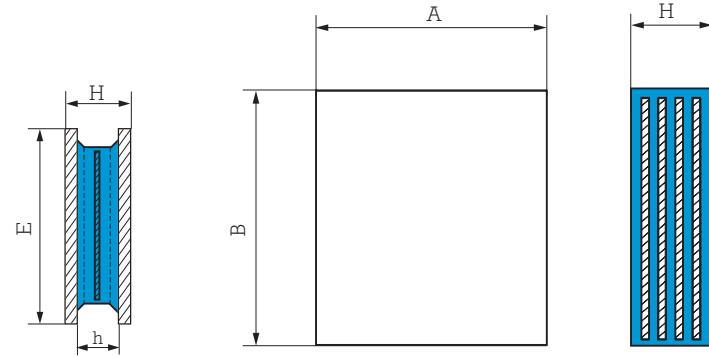

The design of the SANDWICH mounting gives the following basic characteristics:

- Very slim.
- Large surface area.
- Stackable mountings.
- The suspended equipment is free to move in all directions.
- High ratio of axial stiffness to radial stiffness.
- Very high axial loads.

(1) Natural frequencies with max/min loads, see: OPERATING CHARACTERISTICS.

### VERY LOW LOADS MOUNTING (hard disk, etc.)

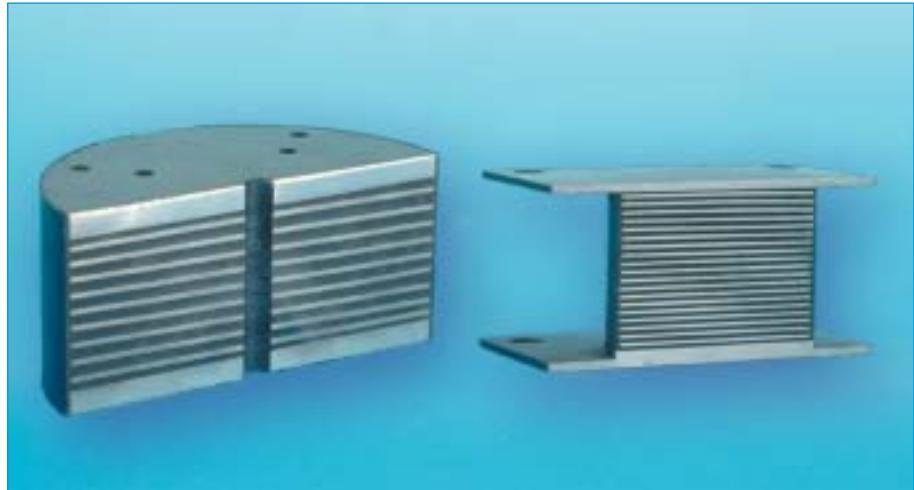

VIBRACHOC reference E4330-F11

1 kg ≈ 1 daN

# LAMINATED ASSEMBLIES

## LAMINATED MOUNTINGS

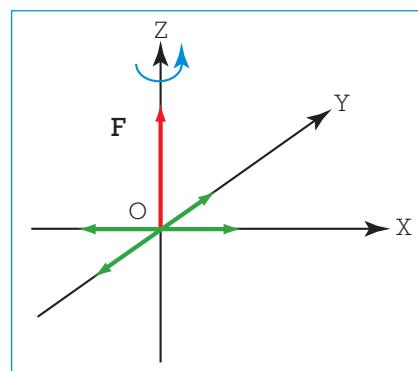

### DESCRIPTION

These assemblies can withstand high compression loads (along Oz): up to 1000 tons/sq.meter.

They can absorb shear deformation (along Ox and Oy) of 50 to 100% of their height.

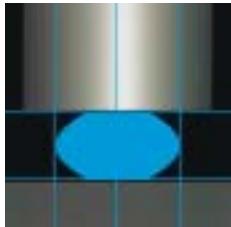

Cylindrical or annular type assemblies can also withstand torsional displacement around axis Oz.

In rotation around axes Oy and Ox, these mountings enable angular or low amplitude rotation errors (approximately 1°).

### APPLICATIONS

- Seismic mountings.
- Helicopter engine suspension systems.
- Expansion joints.

# LAMINATED ASSEMBLIES

## LAMINATED BEARINGS

Fig. 1

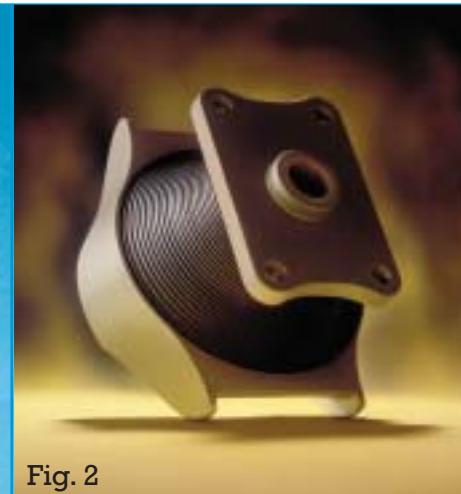

Fig. 2

### DESCRIPTION

Conical (fig. 1) or spherical (fig. 2) units are used to absorb very high axial loads of up to 150 tons.

Angular movement around an axis ( $Oz$  in the case of the conical bearing) or a centre of rotation ( $O$  in the case of the spherical bearing) are in the order of  $\pm 10^\circ$ .

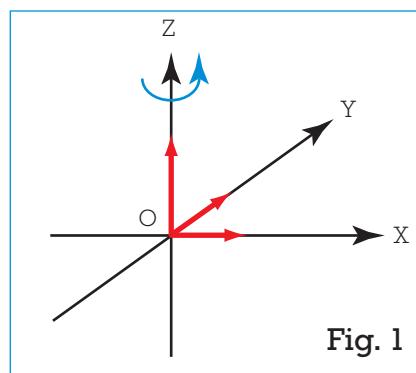

Fig. 1

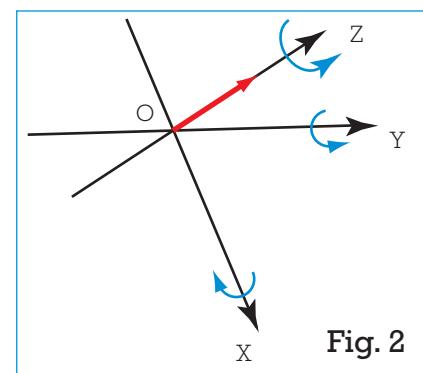

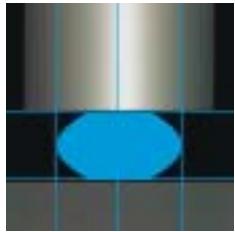

Fig. 2

### APPLICATIONS

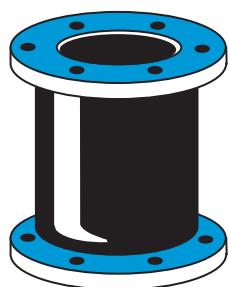

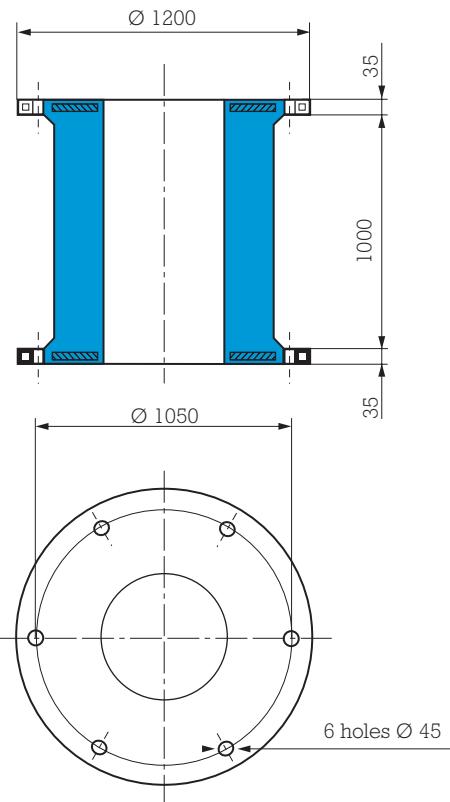

- Oil platform anchoring points.
- Helicopter rotor hub bearings.
- Piping swivel joints.

# STRASONIC®

## DESCRIPTION

STRASONIC is a range of complex materials designed to provide the best acoustic isolation. Their structure is based on polyurethane foams or cellular rubber.

Their main function is to reduce airborne noise (Isolation, Absorption and Damping) in partial or complete enclosures of machinery.

## APPLICATIONS

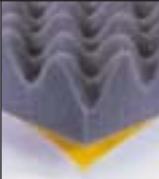

The STRASONIC material can be used in a range of applications such as: air conditioning, pumps, presses, compressors, electric motors, diesel engines, generator sets, gearboxes, turbines, agricultural or construction equipment and other machinery.

Due to their design, they are light, easy to handle and a self adhesive side simplifies the installation (depending on the type of foam).

**Note:** To glue the foams **841001** and **841002**, please contact your usual supplier of glues, or our distribution network.

# CHARACTERISTICS OF THE STRASONIC® RANGE

## POLYURETHANE FOAMS

## CELLULAR RUBBER

Ref.	Structure	Composition and properties	Acoustic performances	Applications
841003		NBR based waterproof cellular rubber, thickness 33 mm. <b>Self adhesive layer on one side.</b> Temperature range static from - 40°C to + 105°C continuous. Very good resistance to oil, ozone, air and UV. Fire resistance: M4/FMVSS 302.	Average absorption factor K $\geq$ 30% from 500 Hz. Very good acoustic performance in high frequencies above 2500 Hz. Approximate gain on a 2 mm steel sheet: - 10 dB (A) at 2500 Hz / - 20 dB (A) at 5000 Hz.	- Sand blasting systems, Saws, - High speed drills, - Vacuum pumps, - Injection presses, - Gearboxes...
841004		EPDM based cellular rubber with half closed cells. Thickness 15 mm. <b>Self adhesive layer on one side.</b> Temperature range continuous from - 40°C to + 130°C. Very good resistance to air, ozone and UV. Very flexible. Good ageing resistance. Waterproof if slightly compressed. Fire resistance: FMVSS 302.	Average absorption factor K $\geq$ 30% from 600 Hz. Very good acoustic performance in high frequencies above 2000 Hz. Approximate gain on a 2 mm steel sheet: - 8 dB (A) at 2500 Hz / - 20 dB (A) at 5000 Hz.	- Air jet positioning, - Sound blasting systems, Saws, - High speed drills, - Vacuum pumps, - Injection presses, - Gearboxes...
841005		EPDM based cellular rubber half closed cells. Thickness 22.5 mm. <b>Self adhesive layer on one side.</b> Temperature range continuous from - 40°C to + 130°C. Very good resistance to air, ozone and UV. Very flexible. Good ageing resistance. Waterproof if slightly compressed. Fire resistance: FMVSS 302.	Average absorption factor K $\geq$ 30% from 500 Hz. Very good acoustic performance in high frequencies above 2000 Hz. Approximate gain on a 2 mm steel sheet: - 10 dB (A) at 2500 Hz / - 27 dB (A) at 5000 Hz.	- Air jet positioning, - Sound blasting systems, Saws, - High speed drills, - Vacuum pumps, - Injection presses, - Gearboxes...

Format: sheets of 500 mm x 500 mm. (tolerance: + 5 to - 30 mm)

# PAULSTRASIL® SOUND AND THERMAL INSULATION PANELS

## DESCRIPTION

A cellular silicon elastomer specially developed for the aerospace, rail and high-tech industries for sound, heat and fire proofing over a large operating range.

## SPECIAL FEATURES

- Meets the FO specifications for smoke toxicity.
- Meets NF P92 501 building specifications (M2 Class autoclave test).
- Meets Veritas grade 2 of the flame propagation capability.
- Meets FAR 25.853 (a) and (b) specifications.
- Meets ATS 1000.001 toxicity test.
- Very low smoke density and opacity.
- Very high resistance to natural ageing (U.V., ozone ...).
- Very high resistance to usual chemicals.
- Easy to use by bonding to all types of supports.
- A self-bonding version is available.

## TECHNICAL DATA (as per A.S.T.M. test method)

Reference	Length x width mm	Thickness mm
820063		1.5
820065	1400 x 1000	3.2

Colour: off-white (others on request).

Operating range: - 60 to + 200°C.

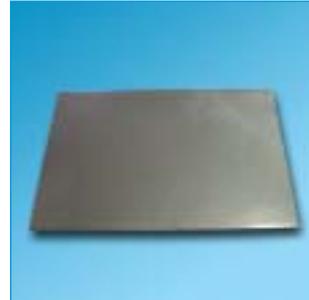

Under no circumstances must the data in the brochure be used for drawing up specifications, these are results obtained in good faith.

Test performed at 890°C

# STRUCTURAL DAMPING SYSTEM

## DESCRIPTION

This damper is made of an high damping material bonded on an aluminium plate; A self adhesive backing is then installed on the elastomer to ease the installation.

This product will reduce vibrations and noise. The damping is due to the shearing of the high damping layer.

## APPLICATIONS

This damper can be used each time we are facing structureborne noise. (Engine compartments, cabs, bodyshells,...)  
Its limited thickness ease it's installation in confined areas.

## CHARACTERISTICS

- Part numbers: 820189 (500 x 500 mm),  
820248 (300 x 200 mm).
- Total thickness: 1,5 mm.
- Weight : 0,7 kg (820189) and 0,2 kg  
(820248) by sheet.
- Temperature range: - 30°C to + 80°C with maximal damping at ambient.

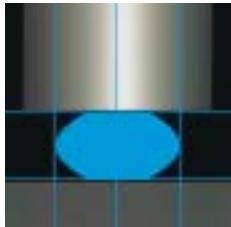

## INSTALLATION

The surfaces must be clean and dry. An acetone type solvant or equivalent can be used for cleaning.

Cut the sheet to the appropriate size. Remove the adhesive protection and lay the sheet on the surface avoiding any air bubble.

In case of an installation on a curved surface, or with an edge, we recommend you to give the right shape to the sheet with the adhesive protection in place.

The constrained layer damping system will be fully operational 72 hours after installation.

# TRIAXDYN

## DESCRIPTION

This anti-vibration mounting comprises two elastomers which are assembled into a casting and pre-loaded.

The mounting is designed to offer:

- a large deflection (in axial),
- different stiffness in three axis,
- built-in stops to limit movement in all directions.

**Note:** The mount body can be modified to offer alternative interface dimensions providing the internal interface with the elastomer is maintained.

## APPLICATIONS

This mounting has been designed to isolate engines or cabs in fixed or mobile applications with a high level of isolation and shock protection. Its compact design enables fail safe suspension of loads from 150 to 280 kg.

It is suitable for:

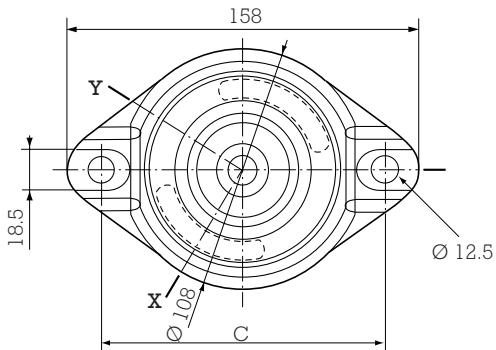

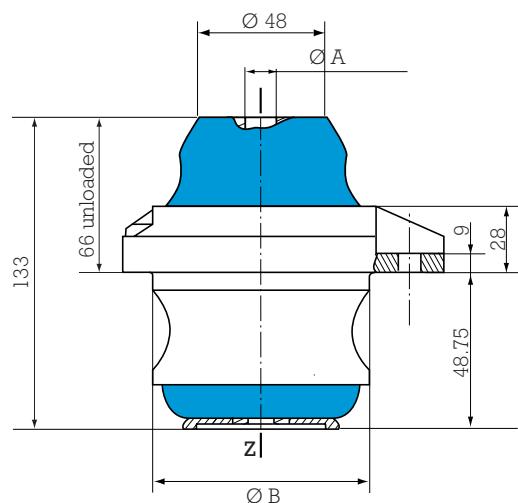

- Engine mounting.
- Cab mounting.
- Equipment mounting.

## OPERATING CHARACTERISTICS AND DIMENSIONS

- Nominal load:
  - 150 to 280 kg.

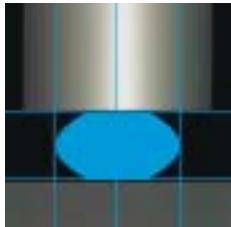

Possibility to extend, on request, the load range up to 350 kg.
- Different stiffness in three axis (for a hardness 50):
  - Axial on Z: 500 N/mm,
  - Radial on X (in direction of voids): 350 N/mm,
  - Radial on Y (at 90 deg. to voids): 500 N/mm.

The geometry of the part provides low dynamic stiffness in the vertical dimension.
- Maximum deflection:
  - Axial:  $\pm 10$  mm,  $\pm 4$  g,
  - Radial:  $\pm 6$  mm,  $\pm 2.5$  g.
- Operating temperature:
  - up to  $+ 80^\circ\text{C}$
- Salt spray protection 400 h. for external aluminium metalwork.

### Mounting:

Reference	$\varnothing$ A mm	$\varnothing$ B mm	C mm

# ENGINE MOUNTINGS

(1) Natural frequency:  
6 Hz

## DESCRIPTION

This engine mounting is made of one conical elastomeric element enclosed in a cast iron assembly. A built-in adjustable stop limits the vertical and lateral displacement during shock. This mount is available in four different alternatives depending on the type of upper fixing needed.

It can be supplied with or without levelling system and with a threaded hole or a threaded stud.

## OPERATION

This mount has been designed to suspend fixed or mobile generators which require a high level of vibration isolation and shock protection. The load per mount varies from 600 kg to 2300 kg. This load range is covered by 5 different variants (12 to 16) clearly identified by a coloured marking (see table).

This mount is available in four different alternatives depending on the type of upper fixing needed:

- 905201: No levelling system - M24 x 3.00 threaded hole
- 905202: Built-in levelling system - M24 x 3.00 threaded hole
- 905203: No levelling system - M24 x 3.00 threaded stud
- 905206: Built-in levelling system - M24 x 3.00 threaded stud

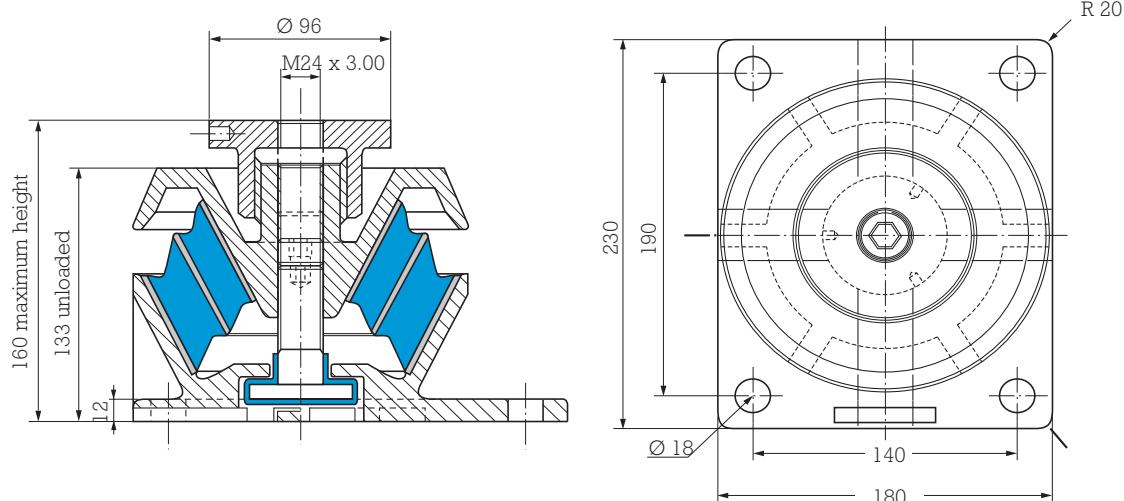

**Note:** Please refer to the drawings overleaf for more details on the different types of mounts.

(1) Natural frequencies with max/min loads, see: OPERATING CHARACTERISTICS.

## OPERATING CHARACTERISTICS AND DIMENSIONS

- Load range:  
Please refer to the chart below for the different variants and their colour marking.
- Deflection under static load:  
8 to 10 mm which gives a natural frequency around 6 Hz.
- Maximum displacement:  
Vertical (Axial):  $\pm 6$  mm.  
Lateral (Radial):  $\pm 5$  mm.
- Structural resistance:  
Vertical (Axial):  $\pm 4$  g.  
Lateral (Radial):  $\pm 3$  g.
- Operating temperatures:  
- 10°C up to + 70°C
- Unit weight:  
11.5 to 12.8 kg (depending on the variant).

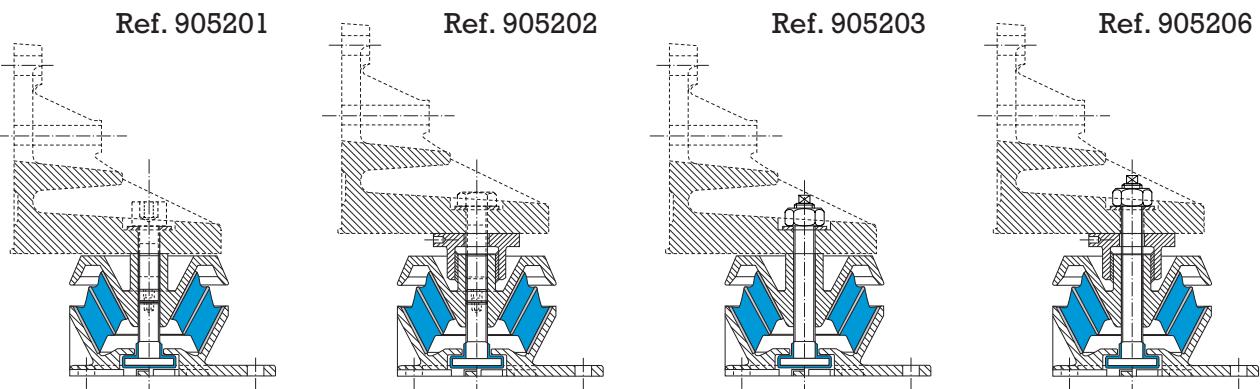

Load range	Variant	Color
600 - 850 kg	12	White
850 - 1150 kg	13	Yellow
1100 - 1450 kg	14	Green
1400 - 1900 kg	15	Blue
1700 - 2300 kg	16	Purple

Reference 905202

## ASSEMBLY

The installation of these mounts and the adjustments of their limit stops once loaded are detailed in an assembly procedure supplied with the mounts.

# ARDAMP®

(1) Natural frequency:  
10 to 25 Hz

## DESCRIPTION

The ARDAMP series dampers have a spring and piston embedded in high viscosity silicone rubber gel which itself is embedded in an elastomer membrane bonded to the case.

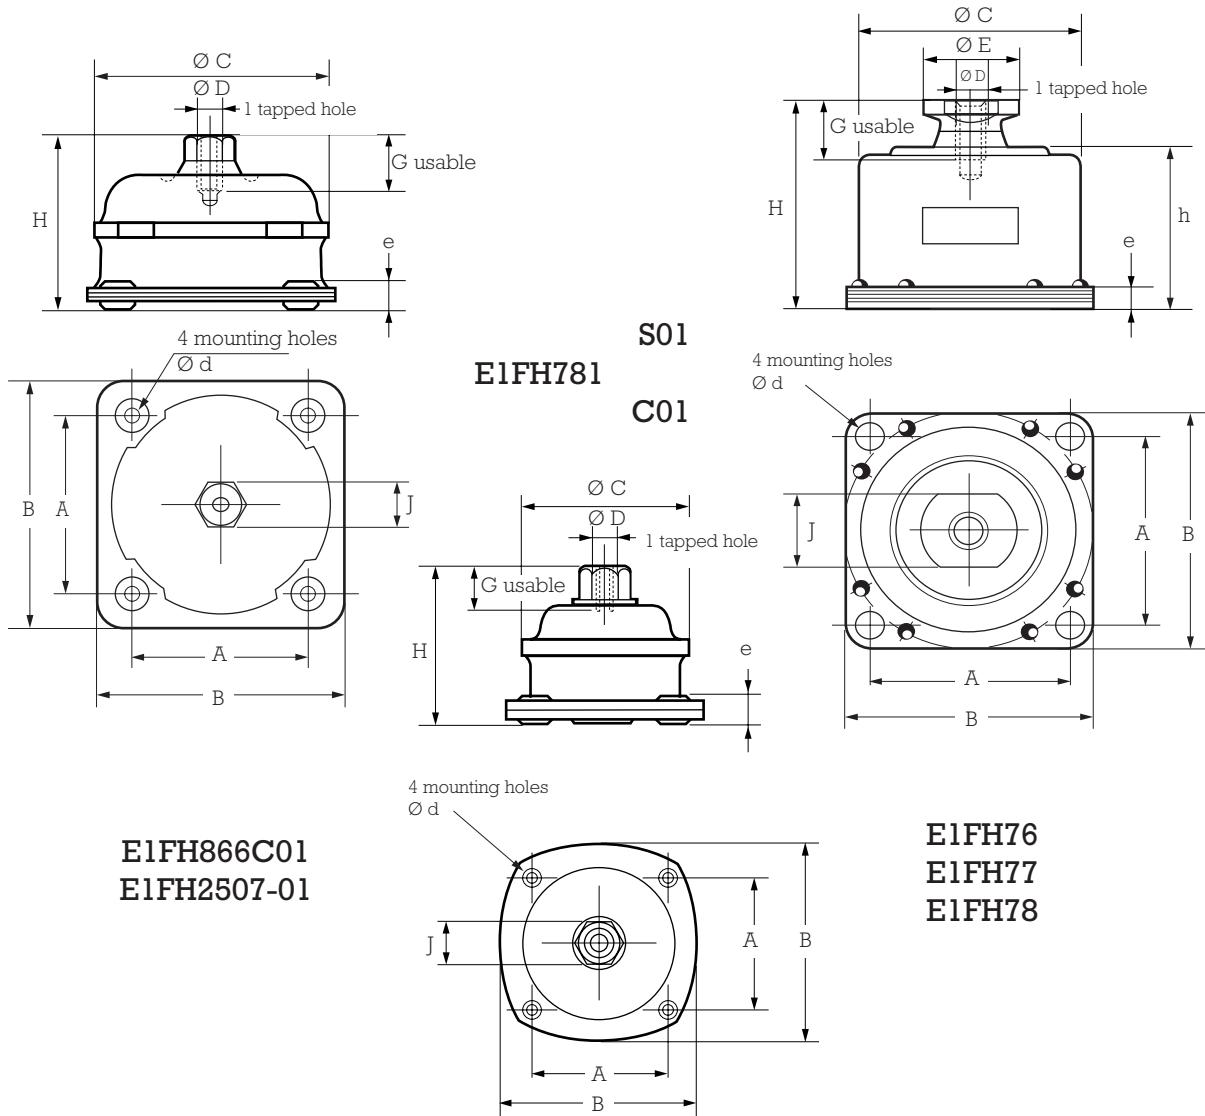

## APPLICATIONS

Due to their high performances and high shock damping capacity ARDAMP dampers are designed to protect fragile electronic equipment, control panels and measuring instruments on ground vehicles, aircrafts, helicopters, civil and military submersible crafts.

(1) Natural frequency with max. load, see chapter: OPERATING CHARACTERISTICS.

## E1C2321 E1T2105 SPECIAL PACKAGING

- (1) Natural frequency:  
10 to 25 Hz

### DESCRIPTION

The special packing dampers have a flexible elastomer element designed for various applications, bonded to two steel mounting plates.

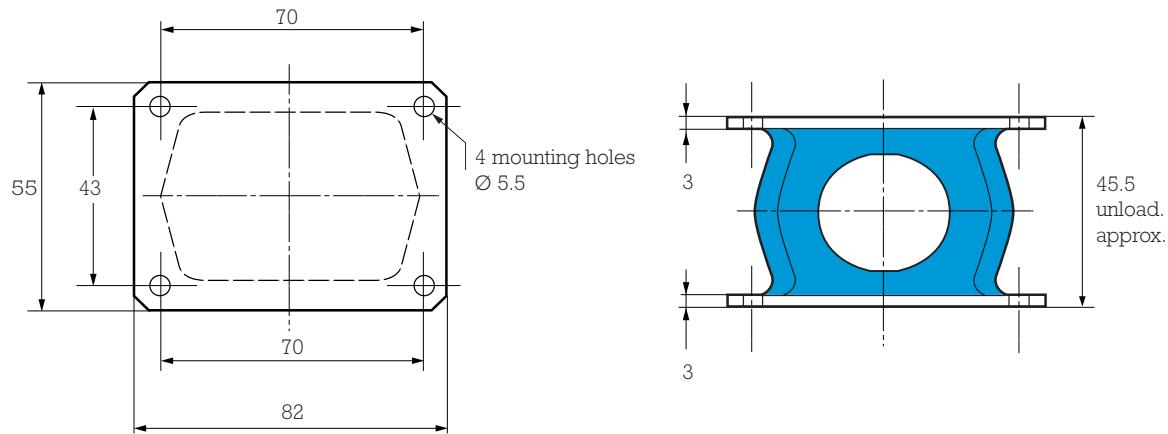

### APPLICATIONS

These multi-directional dampers allow considerable deflection to protect equipment transported in containers against drops and transport shocks (missiles, aeronautical equipment). These dampers are also suitable for suspending equipment to be protected against shocks and vibrations caused by explosions or earthquakes.

(1) Natural frequency with max. load, see chapter: OPERATING CHARACTERISTICS.

# ELASTOMER MOULDED PARTS

SILICONE RUBBER / SPECIAL ELECTRONICS

## CHARACTERISTICS

These parts are usually supplied in VHDS (very high density silicone) rubber and the full reference should include:

- the letter S,
- the appropriate grade which corresponds:
  - to the youngs modulus of the rubber under static compression in accordance with ASTM D945 (ref. 33 to 77),
  - or to the stiffness measured on a part (ref. 16 to 25).

These standard VIBRACHOC grades are shown in the following table:

Reference	Colour	Characteristics		
		G: Shear modul. (MPa)	E: Elast. modul. (MPa)	Stiffness (1)(2) (N/mm) Tolerance: ± 10%
		Tolerance: ± 15%		
16	yellow			19
20	dark blue			20
25	black			25
33	light blue	0.4	1.2	36
38	grey	0.47	1.4	40
42	brown	0.53	1.6	45
48	dark green	0.6	1.8	50
55	brick red	0.67	2.0	55
63	orange	0.8	2.4	65
72	light green	1	3.0	75
77	ultramarine blue	1.1	3.3	100

(1) measured on standardised Ø 19 - h 12.7 mm high part.

1 kg ≈ 1 daN

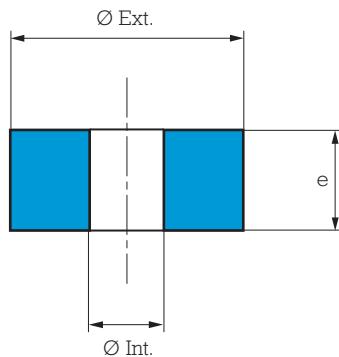

(2) linear region between 1 to 3 mm compression.

Example: E3RP0754S55 flat washer internal diameter 7, external diameter 30, height 6, in VHDS silicone, young modulus 2 MPa; washer colour: brick red.

Other elastomers may be used: natural rubber, neoprene, EPDM, butyl rubber, nitrile rubber.

# ELASTOMER PLATES E3PEPL

## SILICONE RUBBER / SPECIAL ELECTRONICS

### DESCRIPTION

VHDS elastomer sheet.

### APPLICATIONS

These sheets may be used for making grommets, washers or anti-vibration mountings for equipment.

There is a wide range of VIBRACHOC moulded parts, but in certain cases, such as prototypes - undefined specification, etc, it is often advantageous to determine the suspension using elastomer components cut from sheet and bonded.

### CHARACTERISTICS

- Overall tolerances:
  - on the lengths:  $\pm 5\%$
  - on the thickness:  $\pm 3\%$

SHAPE	DIMENSIONS mm	THICKNESS mm
SQUARE	300 X 300	2, 3, 4, 5, 6, 8, 10

VIBRACHOC plates should be ordered using the following reference:

E3PEPL   S   C

1        
2        
3

1: dimension in cm.

2: grade (see. table page 126).

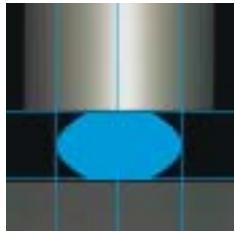

3: thickness in 1/10 mm.

For example: E3PEPL30S55C060 =

- square plate 300 X 300 mm.
- 6 mm thick VHDS rubber compound.
- grade 55.

For other shapes, sizes or materials, ask us for details.

**E1E13S\*\*E\***

(1) Natural frequency:  
20 to 25 Hz

**SILICONE RUBBER / SPECIAL ELECTRONICS**

## DESCRIPTION

- VHDS elastomer able to carry loads under compression and traction.
- Pedestal, washer and shaft in stainless steel.

## APPLICATIONS

- Protecting electronic equipment, navigation equipment, instrument panels, measuring instruments, control panels on aircraft, road vehicles and railway trains.

## CHARACTERISTICS

Natural frequency:

- axial: 20 to 25 Hz
- radial: 20 to 25 Hz.

Maximum permitted excitation at natural frequency of suspension:  $\pm 0.5$  mm.

Amplification factor at resonance < 5.

Operating temperature: - 54°C to + 150°C.

Structural strength corresponds to a continuous acceleration of 10 g at maximum load.

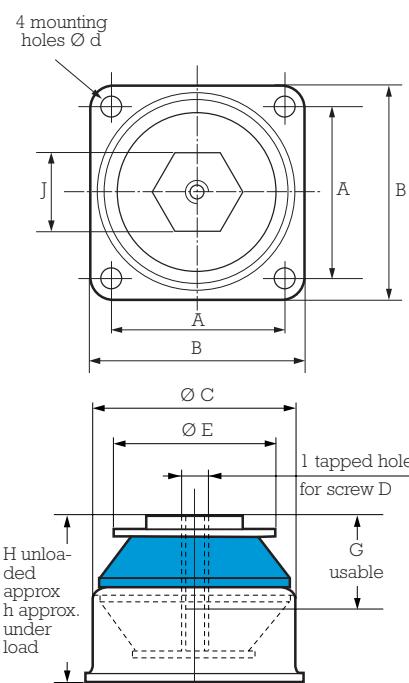

Maximum axial travel available for shock:

E1E11: + 4mm / E1E12: + 5 mm / E1E13: + 7 mm.

Weight: E1E11: 60 g / E1E12: 120 g / E1E13: 225 g.

## DESCRIPTION

- VHDS elastomer able to carry loads under compression.
- Base and centre axis in stainless steel.

## APPLICATIONS

- Protecting electronic equipment, navigation equipment, instrument panels, measuring instruments, control panels on aircraft, road vehicles and railway trains.

## CHARACTERISTICS

Natural frequency:

- axial and radial: 10 to 25 Hz.

Maximum permitted excitation at natural frequency of suspension:  $\pm 0.5$  mm.

Amplification factor at resonance < 4.

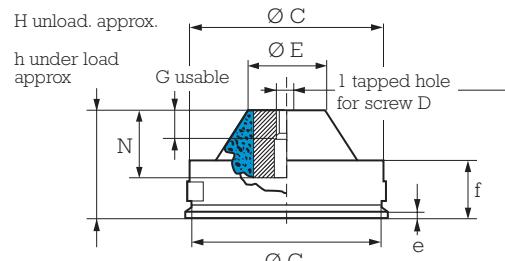

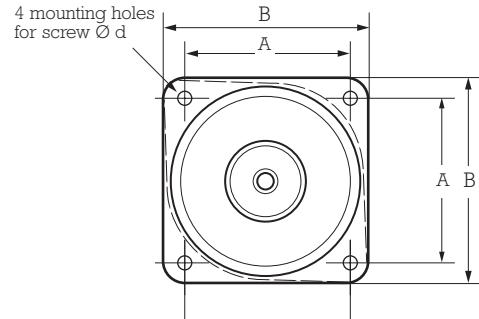

Operating temperature: - 54°C to + 150°C.

Structural strength corresponds to a continuous acceleration of 10 g at maximum load.

Maximum axial travel available for shocks:

E1E41: 8.8 mm / E1E42, E1E43: 12 mm.

Weight: E1E41: 22 g / E1E42: 60 g / E1E43: 96 g.

① These isolators exist with an oval flange (FB).

# PAULSTRA

## ELASTOMER RANGE BARRY CONTROLS

# PNEUMATIC MOUNTS SLM

(1) Natural frequency:  
3 to 5 Hz

## DESCRIPTION

SLM pneumatic mounts are made from synthetic rubber and are laterally reinforced with steel springs.

The base plate is bored with 4 smooth holes to allow a possible fixing on the ground and the valve allows to inflate the mount in the same way as an automobile tyre.

- Elastomer body (temperature range - 30°C to + 80°C) resistant to oils, the majority of solvents and natural ageing.
- The top and bottom plates are available in both steel and aluminium.

## OPERATION

The design of SLM mounts gives the following basic characteristics:

- In the event of pressure loss, the machine will rest on the elastomer body. The load capacity of the mounting remains unchanged.
- The ratio of horizontal rigidity and vertical rigidity of the SLM is 1:1, which allows excellent stability.

### Advantages:

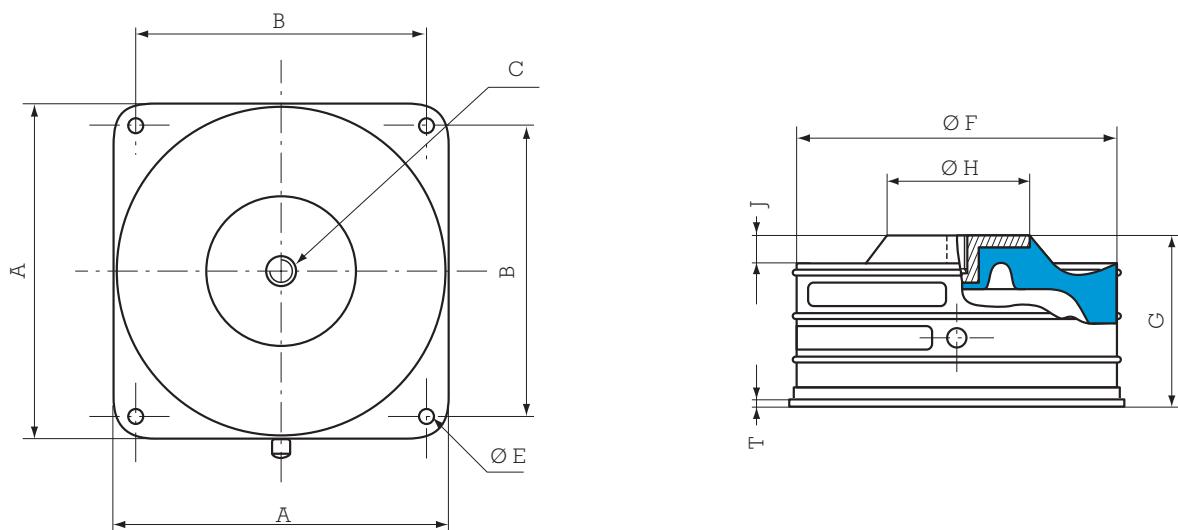

- Eight sizes, capacity range of 10 daN to 10000 daN.
- Allow you to level the machine gradually while varying the air pressure.
- Possibility of varying the natural frequency, by varying the air pressure.

## APPLICATIONS

- Industrial plants, compressors, conveyors, vacuum pumps, generators, air-conditioners, diesel engines, ventilators, presses with fast cycle, machine tools.
- Metrology: measuring apparatus sensitive to the external disturbances, optical instruments, etc.

(1) Natural frequencies with max/min loads, see: OPERATING CHARACTERISTICS.

### PRESSURE OF INFLATION FOR STATIC HEAD AND NATURAL FREQUENCY

## ASSEMBLY

1 - AV mount

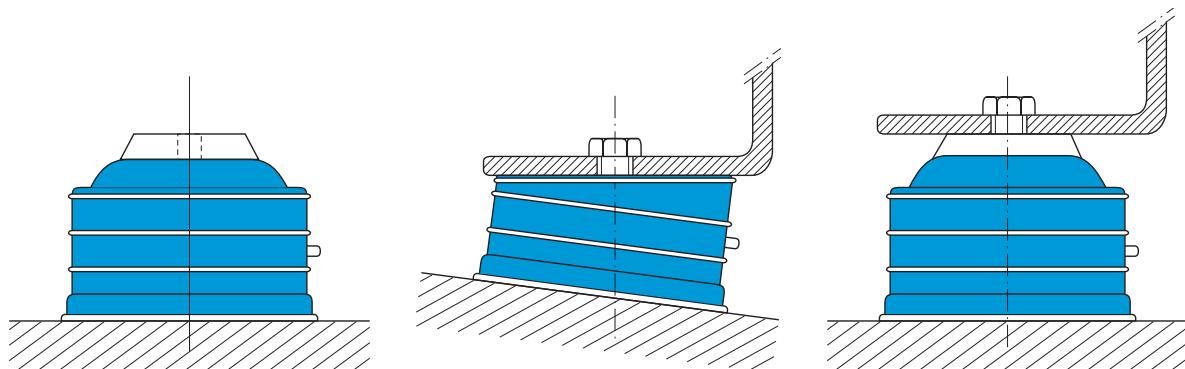

2 - Install the machinery

3 - Inflate the mount

### Correct assembly

#### Recommendations:

- The machine must rest on the supports before they are inflated to the level indicated on dimension " G ".
- Before any dismantling, the SLM mount must be deflated.
- The surface of the machine must completely cover the surface ( $\text{\O F}$ ) of the mount. If it is not possible, use a separate plate (thickness between 5 and 10 mm, according to the load) and diameter equal to  $F + 10$  mm. This is to obtain a base on the full surface. It is required for assembly and in the event of an air leakage.
- If necessary, it is possible to fix the supports using the four smooth holes on the bed plate.
- Make sure care that the valves are protected.
- Never overload the mounts. Always use the recommended load capabilities.

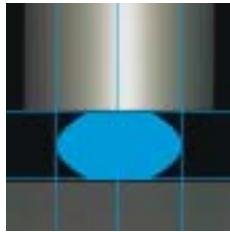

Mount inflated before  
fixing the machinery

Floor not level

Over inflated mount

### Uncorrect assemblies

# 22000 MOUNT

(1) Natural frequency:  
8 to 18 Hz

## DESCRIPTION

The 22000 mount is made of two parts of elastomer bonded to a central tube.

- Interior reinforced: cylindrical tube.
- Elastomer: chloroprene. Range of five different stiffnesses.

## OPERATION

The design of the 22000 mount gives the following basic characteristics.

- Elastomer element resistant to oils, supporting axial and radial loadings.
- Axial to radial stiffness of 1: 1.
- Absorb vibrations and reduce noise in all directions.

### Advantages:

- Good isolation against structural noises.
- Chloroprene resistant to oils.
- Simple and economical.
- Simple to fix.
- Five sizes for a load capacity under axial pressure from 15 to 2100 kg and under radial pressure until 650 kg.
- Anti-rebound effect when it is assembled with a washer.

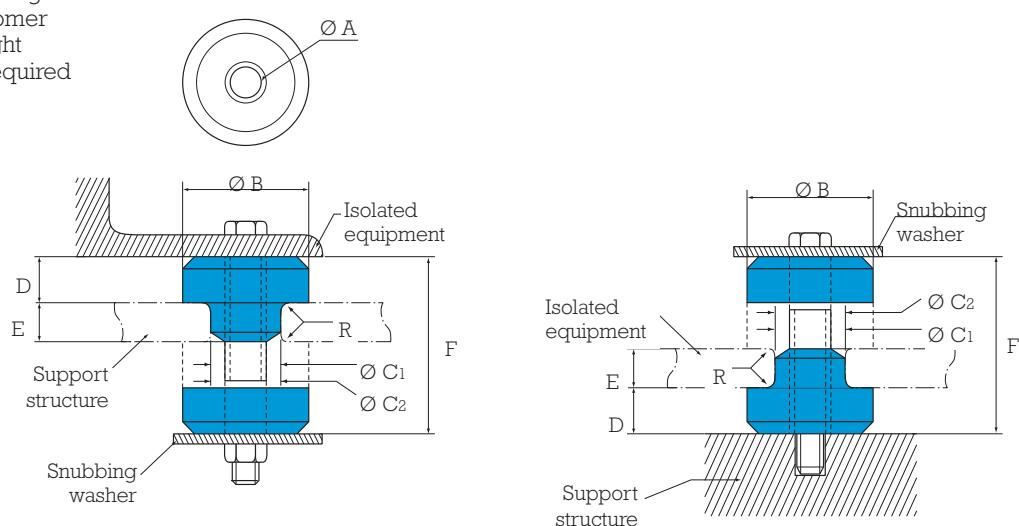

## APPLICATIONS

22000 mounts can be used in static or mobile applications, such as: pumps, compressors, generators, electronic equipment, HVAC equipment, engines with internal combustion, transmissions, plant cabs, radiators, etc.

(1) Natural frequencies with max/min loads, see: OPERATING CHARACTERISTICS.

## LOAD/DEFLECTION CURVES IN AXIAL COMPRESSION

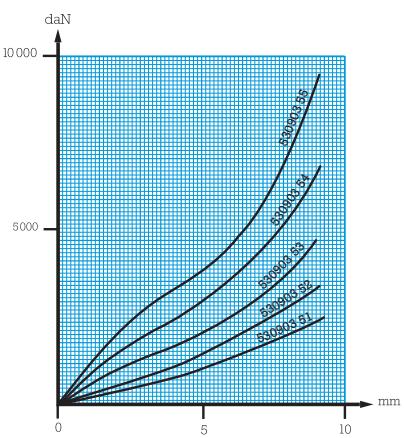

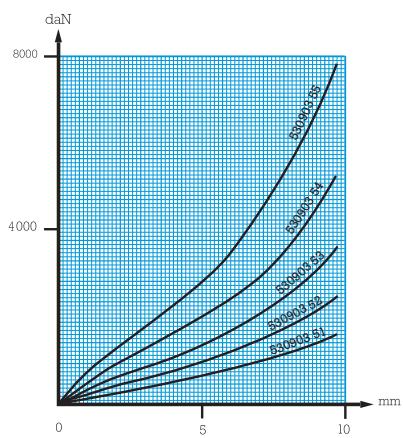

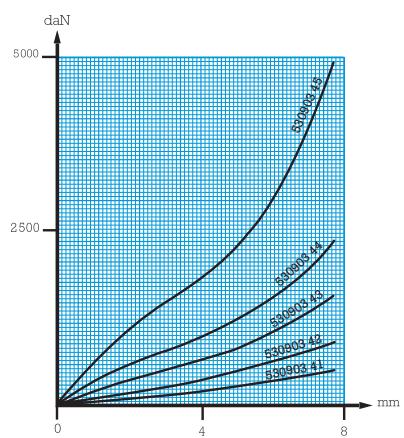

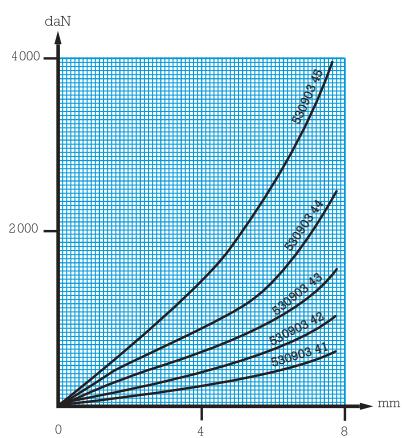

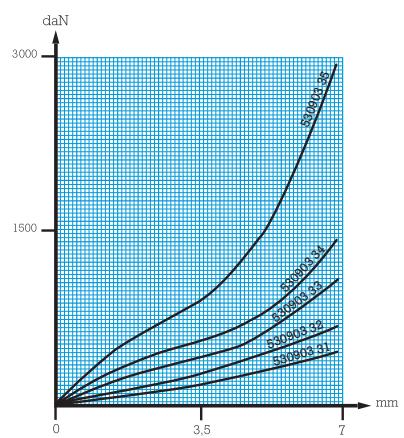

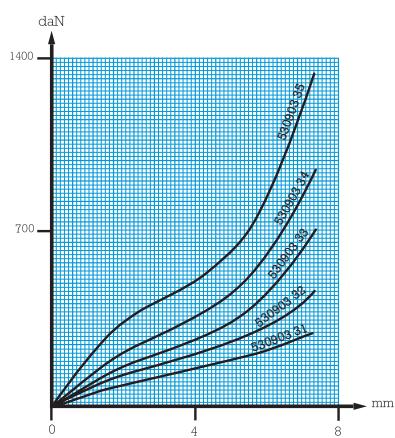

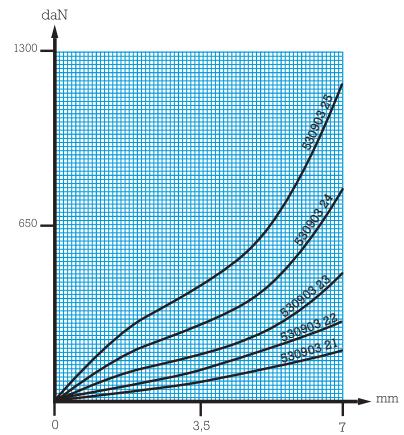

Assembly type E1 and E2

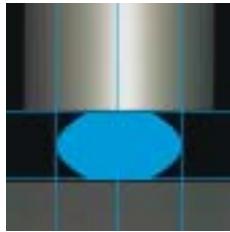

**Assembly type E1**

**Assembly type E2**

# CUPMOUNT

(1) Natural frequency:  
25 to 35 Hz

## DESCRIPTION

The CUPMOUNT is made of rubber bonded to two metal reinforcements of truncated form.

- Interior reinforcement with tapped hole.
- External reinforcements with square base (4 holes).

## OPERATION

The design of the CUPMOUNT gives the following basic characteristics:

- The ratio of radial and axial rigidity of the elements is 1/1, which allows excellent stability.

### Advantages:

- Four models, load capacity of 1 to 1000 daN.
- Support iso-stiffness into axial and radial.
- Can be assembled multidirectional. Effective in compression, traction and shear.
- Chloroprene resistant to oils.
- Easy and fast to install.

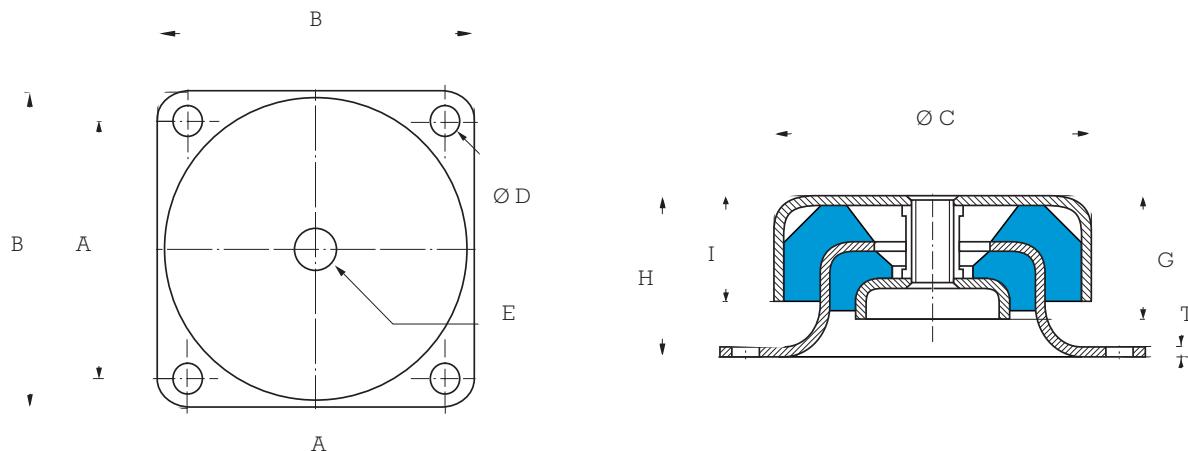

## APPLICATIONS

Engines, pumps, air conditioning, ventilators, transformers...

The CUPMOUNT can also be used for suspended ceilings and for mobile applications.

(1) Natural frequencies with max/min loads, see: OPERATING CHARACTERISTICS.

# RINGS AND BUSHINGS

(1) Natural frequency:  
6 to 28 Hz

## DESCRIPTION

All elements made of elastomer.

Elastomer is compatible with the majority of the industrial environments and has an operating temperature range of - 40°C to + 83°C.

## OPERATION

A ring assembled with the associated bushing constitutes a flexible interface and a simple solution to decrease noise and vibrations.

- These supports can be installed in parallel for a greater load capacity and may also be stacked in series when greater deflection capacity is required.

### Advantages:

- Highly efficient noise reduction.
- Absorb shock and vibrations.
- Simple and economic.
- Four models in four stiffnesses for load capacities going from 0.5 to 160 kg per isolator.

## APPLICATIONS

- Office machines, motors, fans, HVAC equipment, electronics equipment, telecommunication equipment; etc.

(1) Natural frequencies with max/min loads, see: OPERATING CHARACTERISTICS.

## LOAD/DEFLECTION CURVES IN AXIAL COMPRESSION

# FLEX-LOC

## DESCRIPTION

A flexible fixing resistant to oils, the majority of solvents and ageing.

## OPERATION

The design of the FLEX-LOC mount gives the following basic characteristics:

- The rubber works in:
  - compression (axial),
  - shear (radial),
  - compression/shear according to the fixing method.

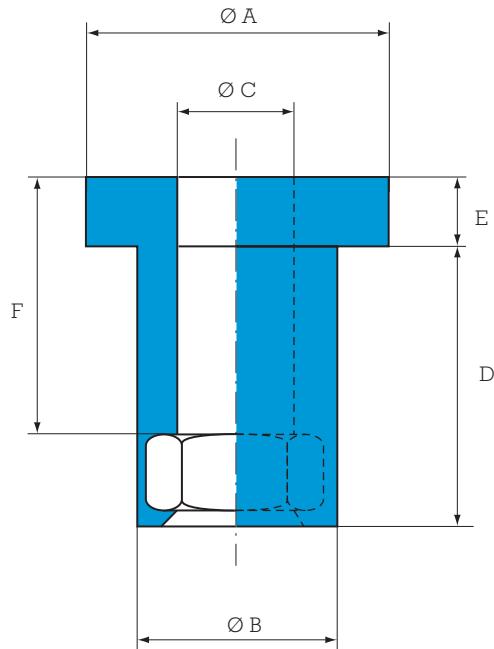

### Advantages:

- 80% reduction of vibrational energy transmitted from normal structural frequencies.
- Simple and economical.
- Simple to fix.
- Light weight.

## APPLICATIONS

FLEX-LOC are suitable for the fixing of sheets, frameworks, engines, ventilators, electronic equipment, computers, etc.

# PAULSTRA

## NAVY SHOCK MOUNTINGS

# NAVY SHOCK MOUNTINGS

## INTRODUCTION

A shock mounting must fulfil the following functions:

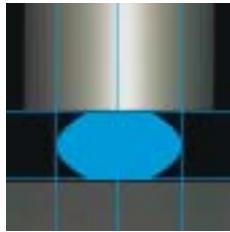

- supporting the suspended mass when there is no shock while providing isolation from vibration and structure borne noise;
- in case of shock: limit the force and/or movement to acceptable values;
- after shock: return the suspended mass to its initial position.

Schematically, there are two types of shock:

- An energy shock resulting from a falling mass for which the parameters taken into consideration are the incident kinetic energy and that restituted, the impact speed and the maximum forces and deflections.
- A shock resulting from a movement of the suspended mass. The parameters taken into consideration are the speed or acceleration of the assembly in time and also the forces relating to the maximum deflection.

## ADVANTAGES

- The mountings described below are intrinsically stable under shock, that is to say, they enable the mass to return to its initial position; the system retains no plastic deformation nor residual buckling when the shock stresses are removed.
- The suspended mass may therefore undergo successive shocks with impunity. Nevertheless, the stability of the assembly in relation to the relative positions of the mountings and the centre of gravity of the suspended mass should be checked.
- PAULSTRA shock mountings are also exceptionally effective against vibration.

# VIBMAR

## VIBRACHOC RANGE

## DESCRIPTION

The VIBMAR series has a base plate with two or four mounting holes and a tapped steel core. The elastomer is bonded to the steel.

E1N104 and E1N106 versions have a conical spring embedded in the rubber.

Environmental protection is provided by painting the metal parts and by coating the elastomer with an ozone resistant compound.

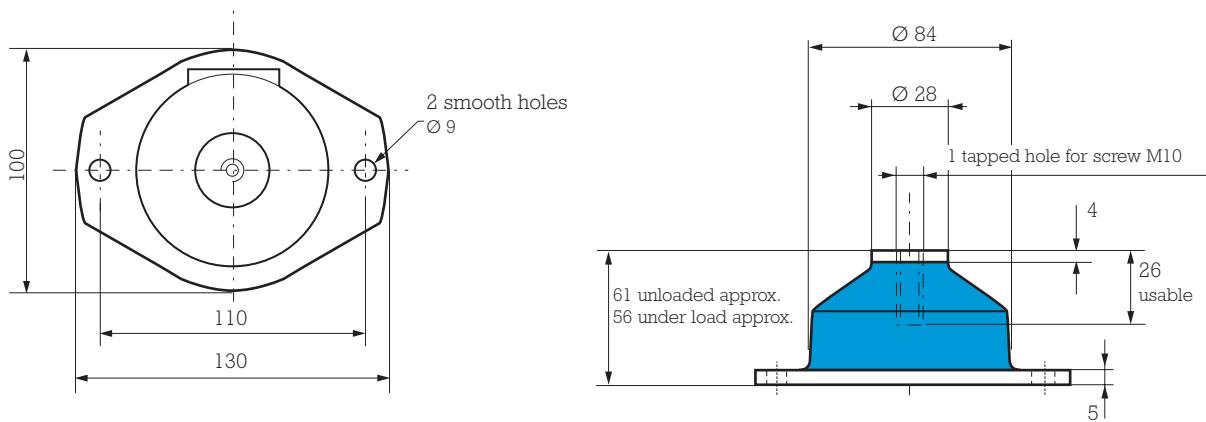

## APPLICATIONS

These multi-axis low frequency dampers have been specially designed to protect electrical or electronic racks and marine or road transport generator sets (on board or not). They are cone-shaped to absorb considerable displacement and shocks.

(1) Natural frequency with max. load, see chapter: OPERATING CHARACTERISTICS.

# VIBMAR E1N2296

## DIMENSIONS

## OPERATING CHARACTERISTICS

Natural frequency:

- axial: 8 to 12 Hz
- radial: 6 to 10 Hz.

Maximum permitted excitation at the natural frequency of suspension:  $\pm 1.25$  mm.

Maximum axial travel available for shocks: 30 mm.

Amplification factor at resonance: < 6 and < 4 for silicone rubber versions.

Structural strength corresponding to a continuous acceleration of 3 g with maximum load.  
When suspending an enclosure, the same type of damper should be used as a stabiliser.

Operating temperature: - 30°C to + 100°C.

- 54°C to + 150°C for silicone rubber versions.

Weight: 0.6 kg.

# VIB HD HIGH DEFLECTION SHOCK MOUNTS

## VIBRACHOC RANGE

## DESCRIPTION

Range of omnidirectional high deflection shock mounts made with a square base plate and a threaded core on the upper side.

The elastomer, in natural rubber, is developed especially for navy applications (other materials on demand).

## ADVANTAGES

These mounts provide both high level of vibration isolation and shock protection. Its high structural strength corresponds to a continuous acceleration of 10 g under maximum load.

The range includes 17 different mounts covering a wide load range from 15 kg up to 1670 kg per mount.

This mount meets the latest US and European shock standards in use in the naval forces across the globe.

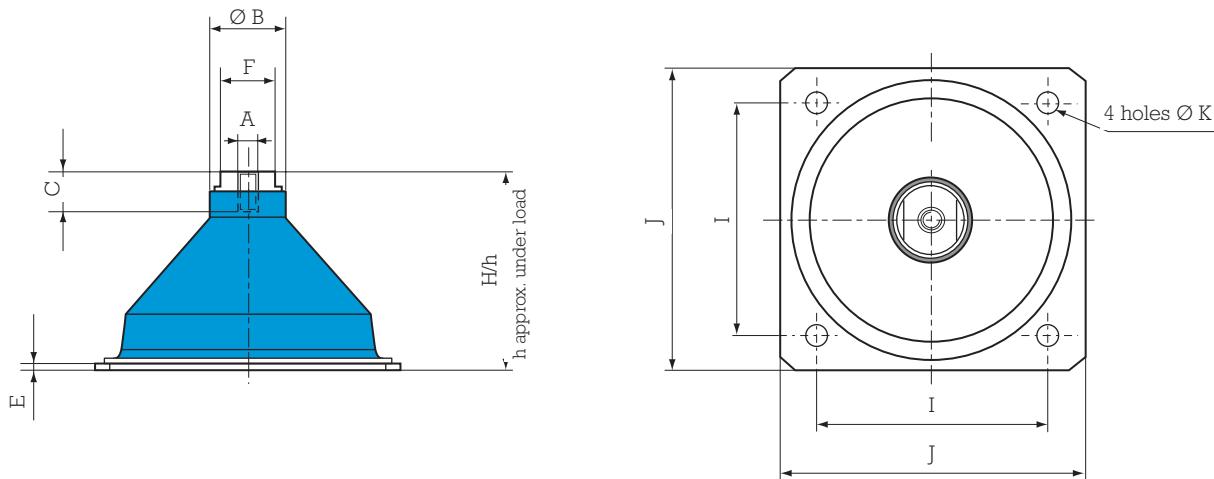

The metallic armatures are protected against corrosion (ie.: salt spray).

## OPERATING CHARACTERISTICS

- Vertical nominal static load: from 15 kg to 1670 kg per mount.
- Axial and radial natural frequencies: 4 to 8 Hz, depending on the load (see chart).
- Maximum axial shock displacement: 45 mm (can be increased with the addition of washers).
- Maximum radial shock displacement: 45 mm.
- Structural strength: 10 g under maximum load.
- Operating temperature: - 30°C to + 80°C.

## ASSEMBLY

These parts are designed to be loaded in compression. They have to be installed on a flat surface covering the entire surface of the base plate. The supported structure is then secured to the central core using a high tensile screw 12.9.

For a better result, the load per mount should be evenly distributed.

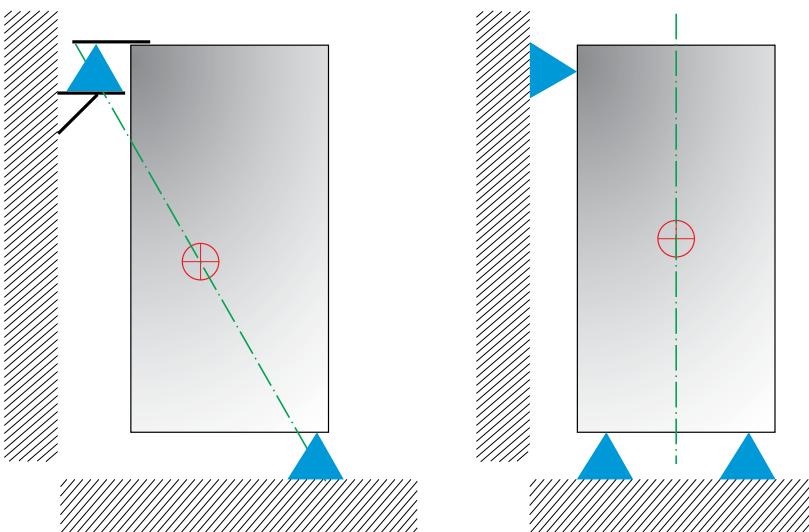

In the case of a tall suspended cabinet, these mounts can be used as stabilizing devices. They will be secured to the suspended cabinet only after stabilization of the main mount.

These mounts are not designed to carry a permanent load in shear or in tension.

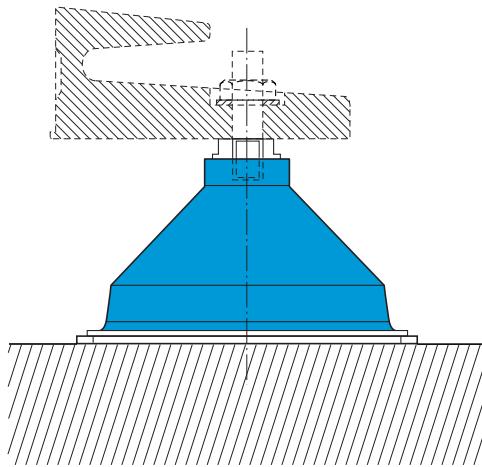

All connections with the suspended cabinets must be flexible and capable to accept high displacement allowing the suspensions to work properly.

We strongly recommend to have your installation approved by our Technical Departement before ordering the mounts.

Installation without washer

Installation with washers

# “X” TYPE FLEXIBLE MOUNTINGS

## VIBRACHOC RANGE

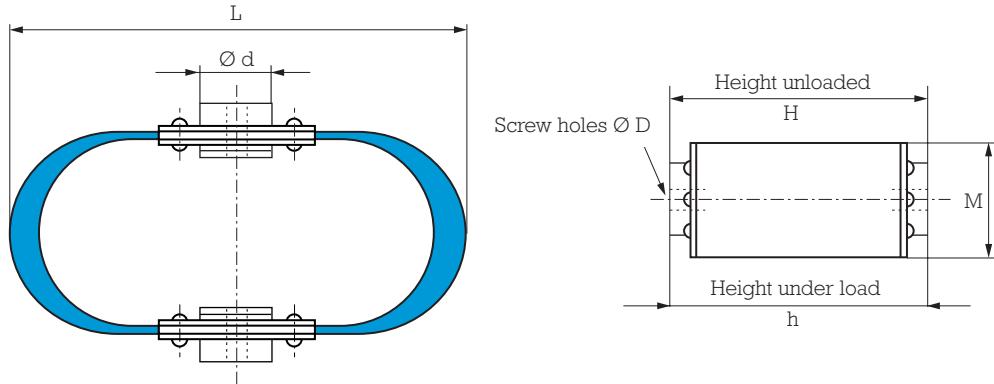

(1) Natural frequency:  
4 to 10 Hz

## DESCRIPTION

Steel mounting with excellent shock absorption capacity, highly resistant to fatigue.

It is made of a stainless steel and epoxy resin sandwich which limits the amplification.

# SUPPORT GB530

(1) Natural frequency:  
5 Hz

BARRY CONTROLS RANGE

## DESCRIPTION

The GB530 comprises of one part in elastomer bonded to a base plate and a tapped steel core (a non magnetic version is also available).

### Advantages:

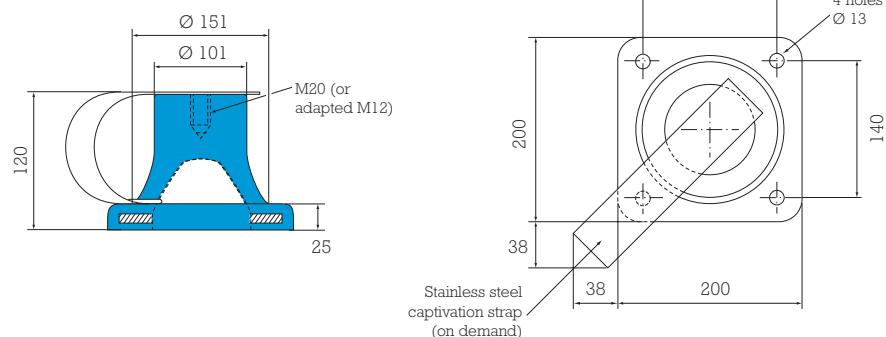

- Can provide high deflection under shocks.
- Long life.
- Low natural frequency (5 Hz in axial).
- Low amplification at resonance.

## APPLICATIONS

These are specific mounts created for the naval industry: on board electronics, radars, special weapons equipment.

## DIMENSIONS

Dimensions are given in mm

## LOW DEFLECTION

## MOUNTINGS

## LOW LOADS

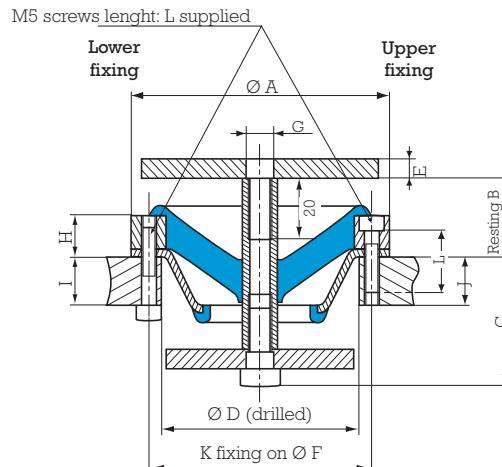

CERTIFIED BY THE FRENCH NATIONAL NAVY - PAULSTRA RANGE

### DESCRIPTION

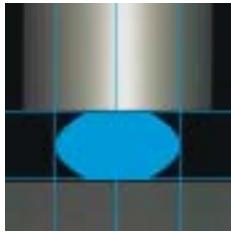

The main role of these mountings is to isolate vibration. A snubber system limits the movement of the suspended mass (10 mm), however the loads developed in this case, are high. A wide load range from 5 to 320 N depending upon the application. In case of shock protection, the structural resistance of the mount can accept acceleration of up to 150g. These mounts are mainly suited for vibration, hence the loads generated in case of shock are very high.

### CHARACTERISTICS

- Natural frequencies (vertical and lateral) under a nominal load of 5 to 8 Hz.
- B = unloaded.
- B - 6 mm height under nominal load (deformation under load  $\approx$  6 mm).
- Maximum deflection from loaded position  $\pm$  10 mm in all directions (vertical and lateral).
- Stop at 10 mm deflection, maximum acceptable loads =  $150 \times$  nominal static load.

## MEDIUM DEFLECTION MOUNTINGS

### HIGH LOADS

CERTIFIED BY THE FRENCH NATIONAL NAVY - VIBRACHOC RANGE

## DESCRIPTION

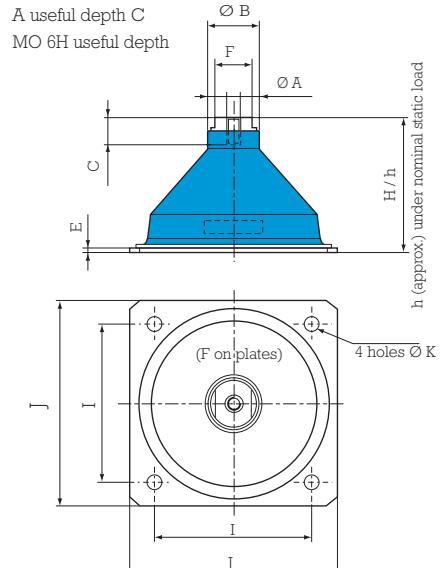

A load range of between 30 to 1,080 kg, depending on the different configuration and shock specification.

Deflections of 45 to 55 mm during shock reduce the transmitted accelerations.

## CHARACTERISTICS

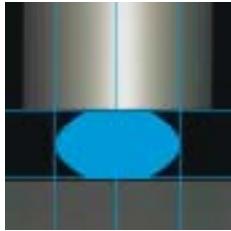

- Natural frequency (vertical and lateral) under load:  
4.5 to 5.5 Hz.
- Maximum deflection under load:  
± 45 mm vertical \*  
± 45 mm lateral \*

\* maximum forces corresponding to 10 times the load.

## MEDIUM DEFLECTION

## MOUNTINGS

## LOW LOADS

CERTIFIED BY THE FRENCH NATIONAL NAVY - PAULSTRA RANGE

### DESCRIPTION

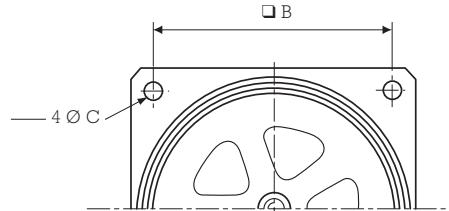

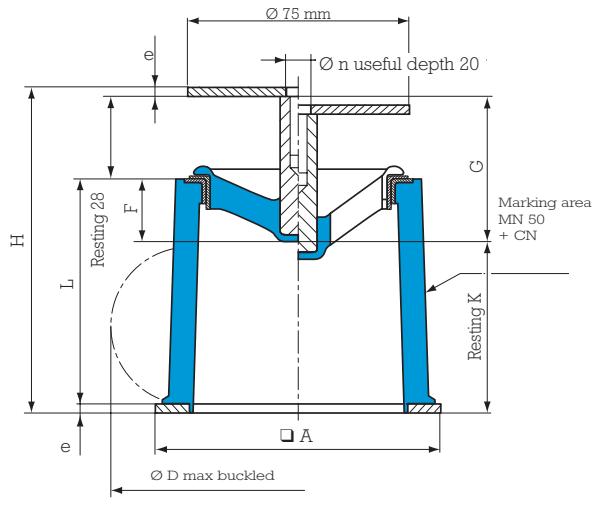

The permitted deflection (40 to 50 mm) of the suspended mass in relation to the mounting base limits reaction under shock. No efficient vibration protection is offered during shock.

### CHARACTERISTICS

- Natural frequency (vertical and lateral) under load of 5 to 8 Hz.
- Maximum deflection under load:
  - vertical:  $\pm 50$  mm\*,
  - lateral:  $\pm 45$  mm\*.

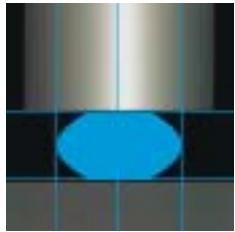

\* maximum forces corresponding to 10 times the load.

- H in rest position.
- H - 6 mm under nominal load  
(deflection under load = 6 mm).

## MEDIUM DEFLECTION MOUNTINGS

### HIGH LOADS

CERTIFIED BY THE FRENCH NATIONAL NAVY - VIBRACHOC RANGE

New !

## DESCRIPTION

A complete range of high deflection omnidirectional mountings. They are made of two cast iron inserts, a threaded steel plate holding the fixing interfaces is added to one end.

The elastomer is a specially developed natural rubber to meet the NAVY requirements. (Other materials can be delivered on request).

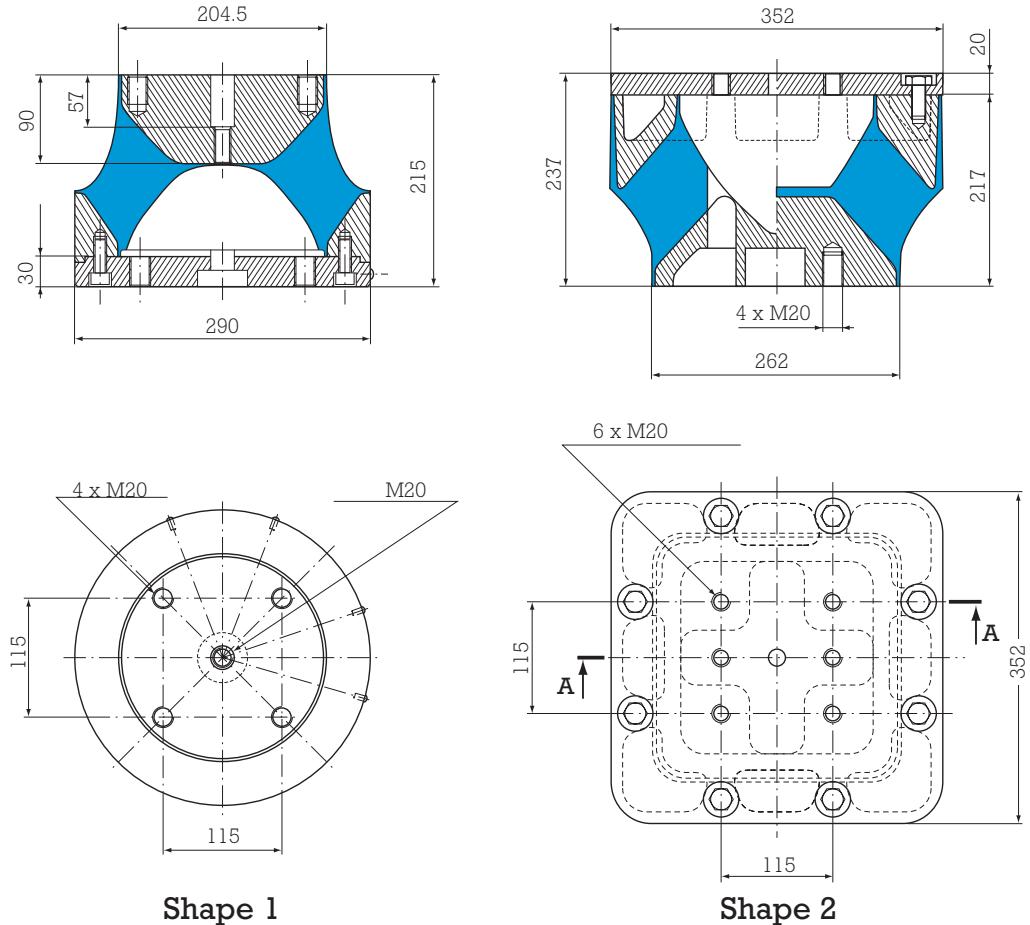

## ADVANTAGES

These mountings will provide both a very high level of vibration attenuation and a high shock capacity to reduce the transmitted acceleration. Its structural resistance corresponds to a continuous acceleration of 10 g at the maximum load. The range is made of 4 references with a load range ranging from 1700 kg up to 5600 kg per mount.

These mounts meet both the European and North American shock standards. The metalwork is treated against corrosion.

These mounts are equipped of preloading holes (M20). An optional snubbing system can be added to the E1N-4066 (Please enquire). The mounts can be tuned to support intermediate loads (Please consult).

## DIMENSIONS

## OPERATING CHARACTERISTICS

- Static nominal load: 1700 kg to 5600 kg per mount.
- Axial and radial natural frequency: 4 Hz to 7 Hz depending on load.
- Radial displacement under shock: 56 to 60 mm (depending on the axis).
- Structural strength: 10 g at maximum load.
- Temperature range: - 30°C up to + 80°C.

Nominal load daN	Reference	Shape	Height under NL mm
1700	E1N-4001-04	1	203
2500	E1N-4001-03	1	203
4000	E1N-4066-71	2	225
5600	E1N-4066-70	2	225

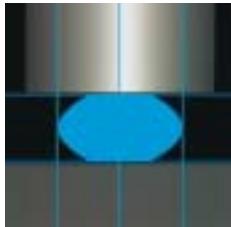

## ASSEMBLY

These mounts are designed to be loaded in compression, they must be installed on a flat surface. The mount is then secured using 4 M20 screw on each side. For a better isolation and shock protection, the load must be evenly spread across the mounts.

In the case of the suspension of a tall cabinet or structure, these mounts can be used as top stabilizers. They will be secured to the supported system only after settlement of the main mounts. These mounts are not designed to support any static load in shear or in tension.

All the connections to the suspended system must be flexible and able to cope with very high levels of deformation in order not to interfere with the suspension.

We strongly recommend to have the installation approved by our technical team prior to order any mount.

## VERY LARGE DEFLECTION MOUNTINGS

### HIGH LOADS

VIBRACHOC RANGE

New !

## DESCRIPTION

A complete range of omnidirectionnal mountings capable of very high displacements under shock. They are made of a diamond base and a central threaded core on the other end.

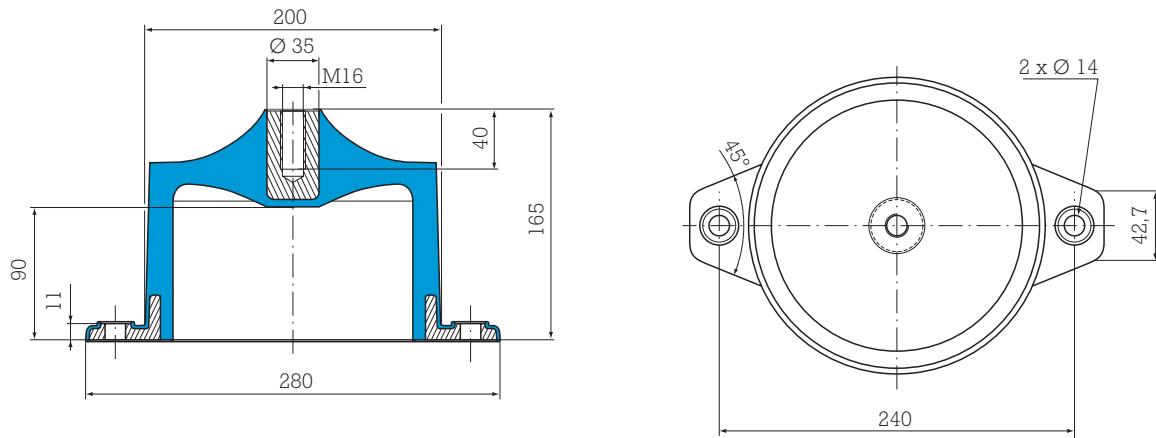

The elastomer is a specially developed natural rubber to meet the NAVY requirements. (Other materials can be delivered on request).

## ADVANTAGES

These mountings will provide both a very high level of vibration attenuation and a high shock capacity to reduce the transmitted acceleration. Their structural resistance correspond to a continuous acceleration of 10 g at the maximum load. The range is made of 7 references with a load range ranging from 8 kg up to 100 kg per mount.

These mounts are an extension of the current MN75 range of mountings. They meet both the European and North American shock standards. The metalwork are treated and fully covered by elastomer for a better corrosion protection.

## DIMENSIONS

## OPERATING CHARACTERISTICS

- Nominal static load: 10 kg to 85 kg per mount.
- Axial and radial natural frequency: 5 Hz to 7 Hz depending on load.
- Axial displacement under shock: 70 mm.
- Radial displacement under shock: 50 to 70mm (depending on the axis).
- Structural resistance: 10 g at maximum load.
- Operating temperatures: - 30°C up to + 80°C.
- Fully covered metalwork to improve the resistance to sea water once installed.

Reference	Nominal load CN (daN)	Maximum static load daN
E 4407 F 01	10	12.5
E 4407 F 02	15	17.5
E 4407 F 03	21	25
E 4407 F 04	30	35
E 4407 F 05	42	50
E 4407 F 06	60	70
E 4407 F 07	85	100

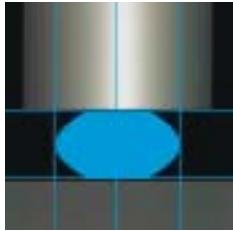

## ASSEMBLY

These mounts are designed to be loaded in compression, they must be installed on a flat surface. The mount is then secured using one M16 screw to the core and two M12 screws on each side of the diamond base. For a better isolation and shock protection, the load must be evenly spread across the mounts.

In the case of suspension of a tall cabinet or structure, these mounts can be used as top stabilizers. They will be secured to the supported system only after settlement of the main mounts. These mounts are not designed to support any static load in shear or in tension.

All the connections to the suspended system must be flexible and able to cope with very high levels of deformation in order not to interfere with the suspension.

We strongly recommend to have the installation approved by our technical team prior to order any mount.

# DECOUPLING WASHERS

CERTIFIED BY THE FRENCH NATIONAL NAVY - VIBRACHOC RANGE

## DESCRIPTION

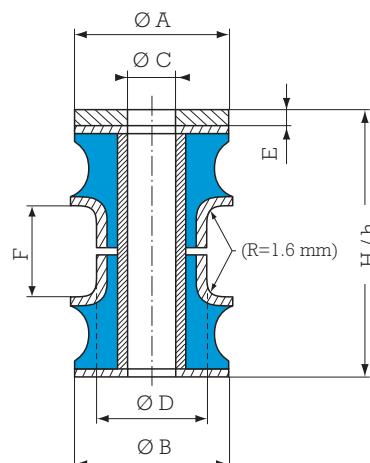

Elastomer rings for linking and positioning of equipment while maintaining acoustic discretion and protection from shocks.

A decoupling washer is composed of:

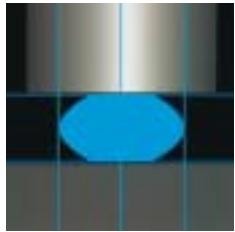

- 2 bonded elastomer washers;
- 1 stainless steel anti-shock washer;
- 1 stainless steel preload spacer.

## CARACTERISTICS

- Natural frequencies (vertical and axial) 15 to 20 Hz depending on load.
- Maximum deflection under shock:
  - axial: 8 mm,
  - radial: 5 mm.
- Mechanical strength corresponding to 30 times the nominal load.

# ACTIVE ISOLATION

## INTRODUCTION

Since 1988, PAULSTRA has designed and developed active isolation systems. These systems are an extension of the PAUSTRA/VIBRACHOC range of product with high efficiency at low frequencies.

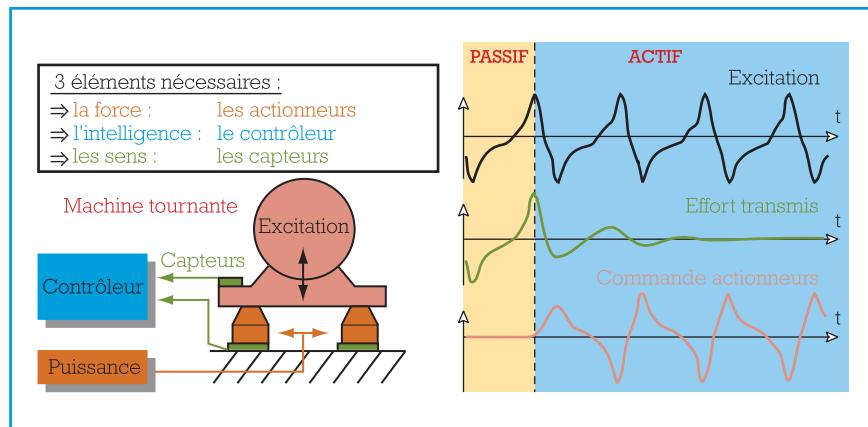

Active control combines our knowledge in vibration control to the efficiency of electronic systems.

The active pad shown on the picture/photo above is added under a conventional mount in order to improve the reduction of noise and vibration.

## ADVANTAGES

- To improve dynamic isolation offered by passive suspensions of the same stiffness.
- To improve uncoupling between structures.
- To simplify the installation of the equipment by reducing or eliminating inertia blocks.
- To reduce structural stress and increase life.
- To reduce noise.
- To reduce movement of connections to equipment.

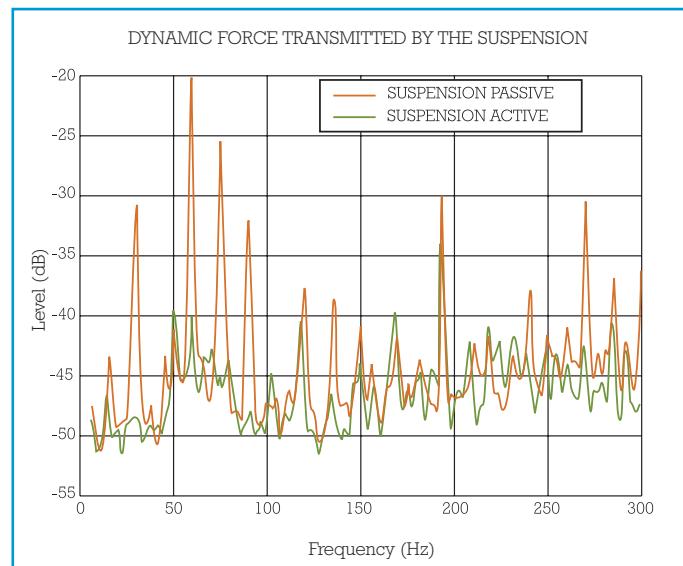

# OPERATING PRINCIPLE

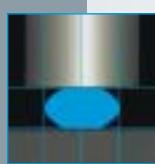

## RESULTS

This graph shows comparison between a machine fitted on a passive suspension (red curve) and an active suspension (green curve).

It clearly shows that active control significantly reduces the levels of the loads transmitted to the structure.
