O-Ring Design Guide

Our Vision

Provide superior value to our customers.

Our Mission

Supply quality products delivered on time, at a competitive cost, backed by a knowledgeable team of sealing professionals, so our customers may grow and prosper.

Introduction

For over 34 years Hi-Tech Seals has been recognized as a leader in the distribution and manufacturing of industrial seals, gaskets, and rubber and plastic solutions. We continually invest in new and innovative products, materials, and services with the intention of helping our customers grow and prosper in an ever-changing world economy.

We offer a personal solution to the business world, tailoring our business relationship to reflect the needs of our clients. We work alongside a variety of industries, while maintaining a high standard for all our products and services. Our diverse supply chain allows our customers to be confident we will provide a solution that meets and exceeds their specifications.

Kit Creation Program

Whether needed for maintenance or manufacturing, our kits are an excellent system to help our customers stay organized, increase efficiency, and simplify the ordering process. Our knowledgeable team of seal professionals can assist with identifying the components and create your custom kit in our system. The kit labels can include company name, logos, part numbers, application information, and other applicable information. When placing an order, simply provide us with one part number and receive all components in one package.

ISO 9001 Registered QMS

At Hi-Tech Seals, we are committed to our Quality Management System (QMS). Our first branch registered under an ISO QMS in 1996. We are proud to state that our entire company is registered under the ISO 9001:2015 Quality Management System. The three main goals of our policy include:

- Hi-Tech Seals shall distribute and/or manufacture a quality product that will meet our customers' expectations and applicable requirements.
- Hi-Tech Seals shall commit to quality objectives agreed upon by senior management, identified through a holistic and collaborative approach involving all potential stakeholders.
- Hi-Tech Seals shall strive to continually improve the Quality Management System (QMS) effectiveness based on efficient processes, well-defined measurements, and best practices.

After Hours Service

If you experience a seal or gasket emergency our technical professionals are available 24 hours a day. Hi-Tech Seals offers after-hours service seven days a week to ensure our customers' businesses can continue operating. To assist our customers to the best of our ability we also offer after hours Rapid Seal machining and Rapid Gasket manufacturing services. *Charges may apply, provided we can assist you.*

O-rings are the most widely used seal in history due to their simplicity, low cost, ease of installation, and small space requirements. The seals versatility enables them to be used in thousands of applications across a multitude of industries and markets. O-rings are designed for both static and dynamic applications and can be used as a double acting seal.

A properly designed O-ring groove allows the O-ring to be squeezed diametrically out of round, even before the application of pressure. The O-ring seals by distortion of its resilient elastic compound to fill the leakage path.

As the name suggests, the O-ring has a circular profile. They are also available in a square cut and quad profile. Square cut rings have the same ID as an O-ring but have different cross sections. Quad rings have the same diameters and cross sections as an O-ring, only their profile shape differs.

Our imperial O-rings are available in standard AS-568 and ISO 3601 sizes. Metric O-rings are available in standard DIN 3771, BS4518, ISO 3601, European sizes, and JIS sizes.

O-Ring Prefixes

* Shore A Hardness

At Hi-Tech Seals, we are fully compliant with ISO 3601-1 dimension and tolerance standards for all Class A standard series O-rings and Class B non-standard series O-rings. Our quality acceptance criteria for all O-rings is in accordance with ISO 3601-3 Grade N. This classifies surface imperfections of O-rings and specifies maximum acceptable limits for these imperfections.

ISO3601-1 Dimensional Tolerances

ISO 3601-1 defines two classifications of O-rings, Class A and Class B. Class A have equivalent tolerances to those identified in AS568 and have tighter tolerances than Class B. They are suitable for industrial and aerospace applications or when the housing requires tighter tolerances. Class B O-rings are suitable for general purpose applications and have slightly wider tolerances than Class A O-rings.

ISO 3601-3 Quality Acceptance Criteria

ISO 3601-3 defines and classifies O-ring surface imperfections into one of three grades N, S, and CS.

- Grade N (general purpose) - Identifies the acceptance criteria for O-rings that are intended for general use applications
- Grade S (special) - Identifies the acceptance criteria for O-rings intended for applications that require a higher level of quality and or precision with respect to dimensional tolerances of surface imperfections
- Grade CS (critical service) - Identifies critical applications where a much higher level of quality and precision is required and the O-ring's surface must be near perfect to perform in a satisfactory manner. For example, critical service aerospace or medical applications

The surface imperfections characterized by ISO 3601-3 include flash, excessive trimming, offset, non-fills, parting-line projection, back rind, flow marks, and indentations.

Standard O-Rings

Standard O-rings are a simple and economical sealing solution that is used in all types of applications, by an extensive range of industries. These seals are designed for both static and dynamic applications. A properly designed O-ring groove allows the O-ring to be squeezed diametrically out-of-round even before the application pressure. The O-ring seals by distortion of its resilient elastic compound to fill the leakage path.

- Most widely used seal in the world
- Simple and effective
- Offers full rebound and compression characteristics of the material
- Straight forward installation

Standard

PTFE Colour Coated O-Rings

Colour-coated O-rings are covered in a thin layer of PTFE that adheres to the O-ring's material. They offer remarkable wear properties, which extend the O-ring's service life. We offer a wide selection of standard colour coated O-rings, and custom colours are available upon request.

Coating O-rings in contrasting colours can help distinguish between similar looking materials and sizes, ensuring the proper O-ring is installed. Customers also take advantage of their low coefficient of friction for easier installation.

- Excellent adhesion, wear, and friction properties
- Easier identification of parts by colour coding
- Eliminates the need for lubricants and grease
- Improves installation
- Increases chemical resistance
- Available in a wide range of colours

PTFE Colour Coated

FEP/PFA Encapsulated O-Rings

Encapsulated O-rings consist of an elastomer inner ring surrounded by a seamless and uniform FEP/PFA casing. The inner ring provides resilience and sealing force of the elastomer, while the casing offers excellent chemical resistance. These O-rings are cost-effective and high-performance seals. They are suitable for critical applications that traditional materials would not withstand.

- Seals in hostile chemicals and temperature environments
- Offers excellent properties with the combination of elastomer flexibility plus the benefit of FEP/PFA chemical resistance
- Easier installation compared to many other highly chemical-resistant seal options

FEP/PFA Encapsulated

O-Ring Cross-Section

The I.D. and O.D. of an O-ring gland is primarily influenced by the diameter of the mating surface of the rod or piston and bore. Although the cross-section of the O-ring may seem arbitrary, there are some distinct advantages to either a larger or smaller cross-section O-ring.

Smaller Cross-Sections Advantages

- More compact
- Lighter weight
- Less expensive; especially for higher cost elastomers like fluorocarbon (FKM) or fluorosilicone (FVMQ, FMQ)
- Less machining required for machined grooves since grooves are smaller
- Increased resistance to explosive decompression

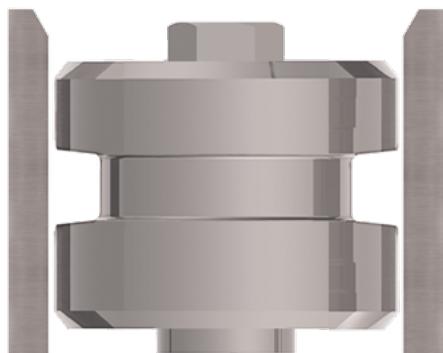

Larger Cross-Sections Advantages

- Less prone to compression set
- Less volume swell in liquid on a percentage basis
- Allows for larger tolerance while still maintaining acceptable compression squeeze and compression ratio over full stack-up range
- Less prone to leakage due to contamination; dirt, lint, scratches, etc.

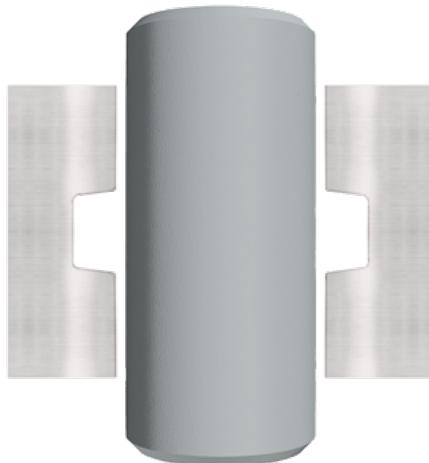

O-Ring Gland Types

O-rings are primarily used to prevent the loss of a fluid or gas. However, O-rings can be used as dust seals, drive belts, or on rotating shafts. Most O-ring seals can be classified into one of the three arrangements or configurations below.

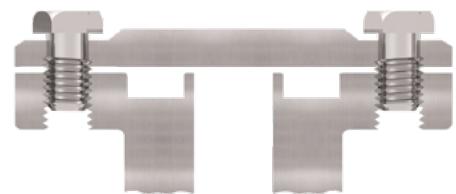

Piston Configuration

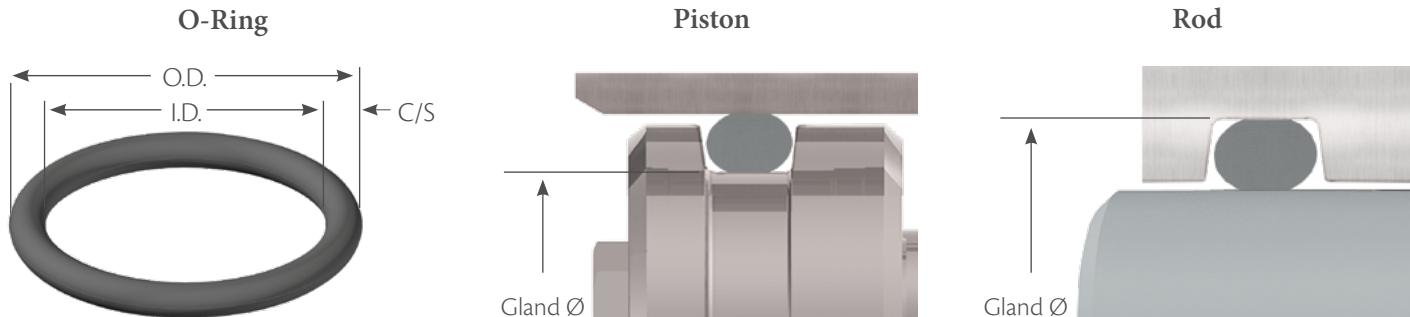

Rod Configuration

Face Type Configuration

I.D. = Inner Diameter

O.D. = Outer Diameter

I.D. Stretch & O.D. Interference

For hydraulic and pneumatic piston sealing applications

The O-ring's I.D. should be stretched between 2% and 5% for dynamic applications and 2% and 8% for static applications. For O-rings with an I.D. smaller than 20 mm, this is not always possible which can result in a wider range of stretch. To minimize this range and the maximum stretch, it is necessary to minimize the tolerance of the piston gland diameter and have a less stringent requirement for the minimum O-ring stretch. In dynamic applications, it is important to keep the maximum stretch to 5% or less to avoid detrimental effects on sealing performance.

For hydraulic and pneumatic rod sealing applications

The O-ring's O.D. should be equal to or larger than the rod gland diameter to give interference on the O-ring O.D. The O-ring O.D. should not exceed 3% of the rod gland diameter for O-rings with an I.D. greater than 250 mm, or 5% for O-rings with an I.D. smaller than 250 mm. For O-rings with an I.D. smaller than 20 mm, this is not always possible due to tolerance issues, which can result in a greater O-ring O.D. interference.

Reduction in Cross-Section

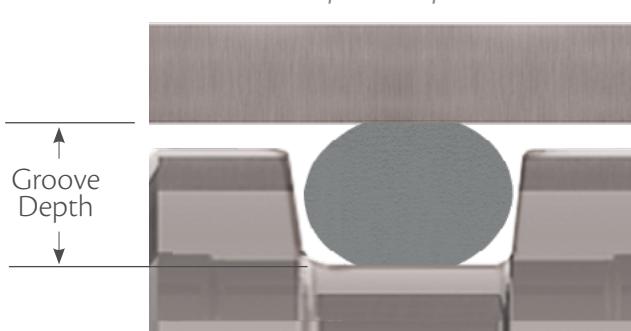

If the I.D. of the O-ring is stretched, the cross-section of the O-ring will decrease. The following table gives the O-ring cross-sections that result from various percentages of I.D. stretch.

O-Ring Series	O-Ring C/S		Reduced O-Ring C/S at % ID Stretch (Inch / mm)				
	Inch	mm	1%	2%	3%	4%	5%
000	0.070	1.78	0.069 / 1.76	0.069 / 1.74	0.068 / 1.73	0.068 / 1.71	0.068 / 1.69
100	0.103	2.62	0.102 / 2.59	0.101 / 2.57	0.100 / 2.54	0.100 / 2.52	0.100 / 2.49
200	0.139	3.53	0.138 / 3.49	0.137 / 3.46	0.136 / 3.42	0.135 / 3.39	0.134 / 3.35
300	0.210	5.33	0.208 / 5.28	0.206 / 5.22	0.205 / 5.17	0.204 / 5.12	0.203 / 5.06
400	0.275	6.99	0.272 / 6.92	0.270 / 6.85	0.268 / 6.78	0.267 / 6.71	0.266 / 6.64

Compression

Compression squeeze is the difference between the original O-ring cross-section and the final O-ring cross-section once installed.

$$\text{Compression Squeeze} = \frac{\text{C/S} - \text{Groove Depth}}{\text{C/S}}$$

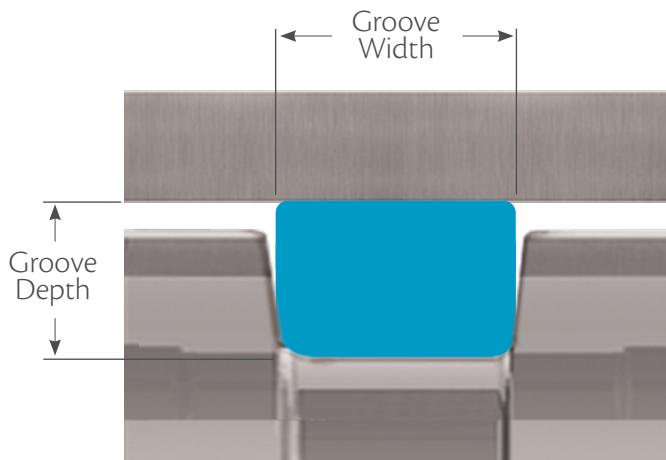

This can usually be expressed as a percentage:

$$\text{O-ring C/S Squeeze (\%)} = \frac{\text{Compression Squeeze}}{\text{C/S}} \times 100$$

For recommended O-ring C/S squeeze (%) values please refer to page 15 and 16.

Gland Fill

The gland fill is the percentage of the gland that is occupied by the O-ring. It is calculated by dividing the cross-sectional area (CSA) of the O-ring by the cross-sectional area of the gland.

$$\text{Area of a circle} = \pi r^2 \text{ and } r = \frac{d}{2}, \text{ where } d = \text{diameter (C/S)}$$

$$\text{Therefore, O-ring CSA} = \pi \left(\frac{C/S}{2} \right)^2$$

$$\text{Gland CSA} = \text{Groove Depth} \times \text{Groove Width}^*$$

$$\text{Gland Fill (\%)} = \frac{\text{O-ring CSA}}{\text{Gland CSA}} \times 100$$

* Effect of gland angle and extrusion gap not addressed.

It is important to consider the groove fill or occupancy of the installed O-ring to avoid detrimental effects on radial sealing performance. The groove fill of the installed O-ring should not exceed 85 % to allow for possible O-ring thermal expansion, volume swell due to fluid exposure and effects of tolerances.

Volume change is the increase or decrease of the volume of an elastomer after it has been in contact with a fluid, measured in percent (%). For static O-ring applications volume swell up to 30 % can usually be tolerated. For dynamic applications, 10 or 15%

swell is a reasonable maximum unless special provisions are made in the gland design itself. This is a general rule and there may occasionally be exceptions.

It is also important to note there are significant differences in the coefficients of thermal expansion between the O-ring material and the groove materials. Elastomers can have coefficients of thermal expansion 7 to 20 times higher than that of metal, such as steel.

Extrusion Gap

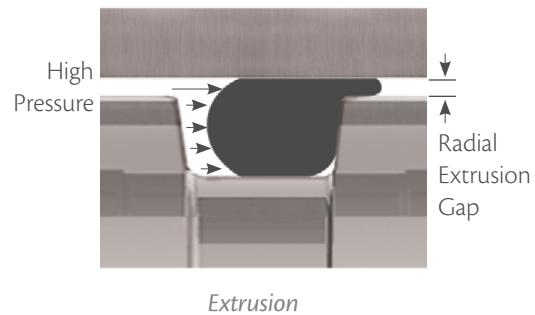

Extrusion is a concern for radial seals where there is a gap between the piston and the bore for a piston type seal or between the rod and throat diameter for a rod type seal. It is not typically a concern for face type seals where the metal parts to be sealed are in contact line-to-line. The issue is that at higher pressures and especially for softer O-ring elastomers, the O-ring can be forced

by the pressure into the small gap between the piston (or rod) and the bore (throat diameter). Unless the bore (throat diameter) and the piston (or rod) are ensured to remain concentric by the hardware, we have to assume that entire possible gap can shift to one side (see diagram below).

Piston Type Seal

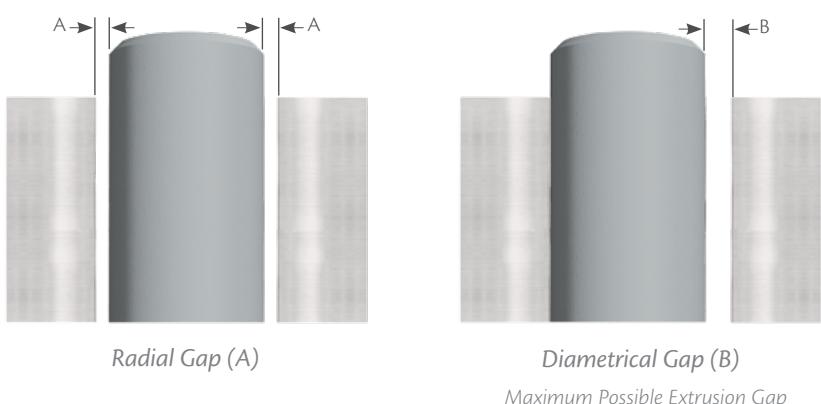

$$\text{Radial Extrusion Gap} = \frac{\text{Bore } \varnothing - \text{Piston } \varnothing}{2}$$

\varnothing = Diameter

Rod Type Seal

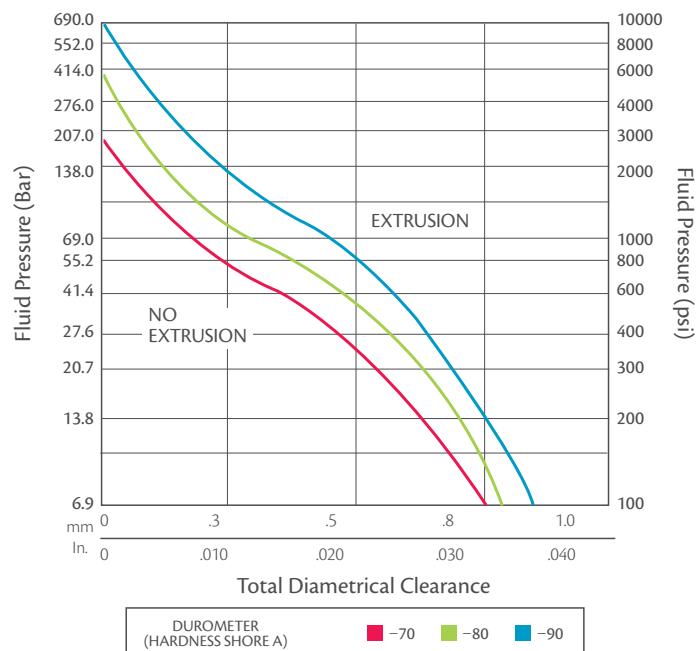

$$\text{Radial Extrusion Gap} = \frac{\text{Bore } \varnothing - \text{Rod } \varnothing}{2}$$

Limits for Extrusion

There are different methods to counter O-ring extrusion. One of these methods is to simply increase the durometer rating of the O-ring. However, as the durometer is increased, the O-ring can become less malleable. Another option would be to use anti-extrusion devices. These are thin rings made of hard plastic materials such as KasPex™ PEEK, PTFE, and nylon. Once in place these rings will provide essentially zero clearance.

Reduce the clearance shown by 60% when using silicone or fluorosilicone elastomers.

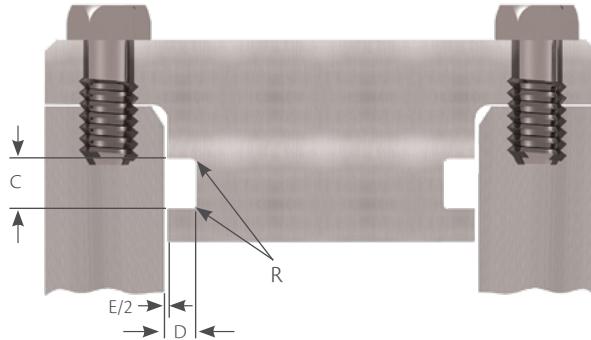

Groove Dimensions - ISO 3601

Static Radial Applications

Hardware Conditions

The metal hardware specifications of the O-ring gland and any mating part has a significant impact on the life and sealing performance of the O-ring. The following are general fluid sealing surface roughness values for glands using elastomeric O-Rings:

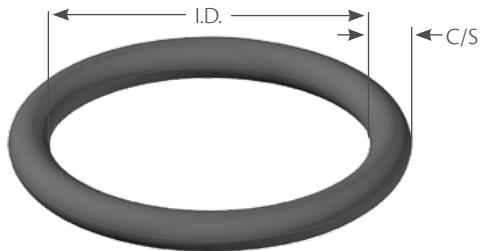

For a static mating surface: Ra 32 μ inch maximum

For a dynamic mating surface: Ra 3-12 μ inch

The recommended minimum shaft hardness is 50 HRC (Hardness Rockwell C).

For more detailed surface finish guidelines (gases, cryogenics, etc.), please contact our engineering team at engineering@hitechseals.com

O-Ring Tolerances

We offer O-rings in sizes ranging from 400-424. These O-ring size dimensions and tolerances are unassigned under ISO 3601. In addition, we stock specific non-standard C/S O-rings such as 3/8", 1/2", and 3/4".

Extrusion or Nibbling

When extrusion or nibbling occurs, the seal develops ragged edges, which can leave it looking tattered. This generally appears on the low-pressure side. In general, extrusion failures are caused by one of more of the following factors:

- Excessive clearances
- Excessive pressure
- Low modulus or hardness elastomer
- Excessive gland fill
- Irregular clearance gaps
- Sharp gland edges
- Improper sizing

Solutions to prevent extrusion include:

- Decreasing clearance
- Use a higher-modulus or harder elastomer
- Properly designing the gland
- Using polymer back-up rings

Over-Compression

Over-compression causes mating surfaces to appear flat. It may also cause the flattened surfaces of the seal to develop circumferential splits. In general, over-compression failures are caused by one of more of the following factors:

- Improper design (failure to account for thermal expansion)
- Chemical volume changes
- Excessive compression

One solution to prevent over-compression is to consider the material's response to chemical and thermal environments during the gland design process.

Abrasion

Abrasion generally happens in dynamic seals, subjected to reciprocating, oscillating or rotary motion. This failure causes laceration and breaking on the O-ring's surface that experience excessive wear. Abrasion is caused by one or more of the following:

- Rough sealing surfaces
- Excessive temperature
- Process environment containing abrasive particles
- Dynamic motion
- Poor elastomer surface finish

Solutions to prevent abrasion include:

- Use recommended gland surface finishes
- Consider internally lubed elastomers
- Eliminate abrasive components

Compression Set

Compression set causes an O-ring's cross section to lose its circular or O-shape and resemble a flat sided oval. The flat side corresponds to the mating seal surfaces. Contributing factors may include one or more of the following:

- Excessive compression
- Excessive temperature
- Incompletely cured elastomer
- Elastomer with high compression set
- Excessive volume swell in chemical

Solutions to prevent compression set include:

- Low compression set elastomer
- Proper gland design for the specific elastomer
- Confirm material compatibility

Outgassing or Extraction

This failure is difficult to detect as the O-ring typically shows no visible change. In some instances, it may exhibit a decrease in cross-sectional size. In general, outgassing or extractions are caused by one of more of the following factors:

- Improper or improperly cured elastomer
- High vacuum levels
- Low hardness or plasticized elastomer

Solutions to prevent outgassing include:

- Avoid plasticized elastomers
- Ensure all seals are properly post-cured to minimize outgassing

Installation Damage

Damage that occurs to the O-ring during the installation process presents as small cuts, nicks, and gashes to the surface. Installation damage can be caused by one of more of the following factors:

- Sharp edges on the glands or components
- Improper sizing of elastomer
- Low-modulus or low-hardness elastomer
- Elastomer surface contamination

Solutions to prevent installation damage include:

- Remove all sharp edges
- Proper gland design
- Proper elastomer sizing
- Use a higher-modulus or harder elastomer

Chemical Degradation

When chemical degradation occurs, the seal may exhibit signs including blisters, cracking, voids, or discoloration. In some cases, the degradation is observable only by measurement of physical properties. In general, chemical degradation is caused by:

- Incompatibility with the chemical and or thermal environment.

To prevent this failure from happening, use a more chemical-resistant elastomer.

Thermal Degradation

Thermal degradation may cause radial cracks to appear on the O-rings. They will be located on the highest temperature surfaces. In addition, certain elastomers may exhibit signs of softening or shiny surface as a result of excessive temperatures. In general, thermal degradation are caused by one of more of the following factors:

- Elastomer thermal properties
- Excessive temperature excursions or cycling

Solutions to prevent thermal degradation include:

- Selecting an elastomer with improved thermal stability
- Evaluation of the possibility of cooling sealing surfaces

Spiral Failure

When a spiral failure occurs, a spiral pattern or mark appears on the circumference of the O-ring. Spiral failures are typically caused by one or more of these factors:

- Difficult or tight installation (static)
- Slow reciprocating speed
- Low-modulus or durometer elastomer
- Irregular O-ring surface finish, including excessive parting line
- Excessive gland width
- Irregular or rough gland surface finish
- Inadequate lubrication

Solutions to prevent spiral failures include:

- Correct installation procedures
- Use a higher-modulus elastomers
- Internally lubed elastomers
- Proper gland design
- Gland surface finish of 8-16 micro-inch RMS
- Possibly use polymer back-up rings

Plasma Degradation

When plasma degradation occurs, there is erosion on the O-ring where it was exposed to the plasma. This type of failure generally happens in electrical applications. In some cases, this appears as discolouration or powdered residue on the surface. Contributing factors may include:

- Chemical reactivity of the plasma
- Ion bombardment (sputtering)
- Electron bombardment (heating)
- Improper gland design
- Incompatible seal material

Solutions to prevent plasma degradation include:

- Plasma-compatible elastomer and compound
- Minimize exposed area
- Examine gland design

Contamination

When this failure occurs, the foreign materials or contaminants are visible on the surface of the O-ring. In general, contamination is caused by:

- Process environment deposition
- Reactions or degradation of the elastomer
- Non-semiconductor-grade elastomer

To prevent this failure from happening specify contamination level including manufacturing and packaging of the seals.

Rapid Gas Decompression

O-rings that have undergone rapid gas decompression (RGD) exhibit blisters, pits, or pockets on their surface. RGD occurs when there is absorption of gas at high pressure and the subsequent rapid decrease in pressure. The absorbed gas blisters and ruptures the elastomer surface as the pressure is rapidly removed. In general, rapid gas decompression is caused:

- Rapid pressure changes
- Employing elastomer materials that are susceptible to gas permeation
- Low-modulus or low-hardness elastomer

Solutions to prevent rapid gas decompression include:

- Use RGD certified elastomer compounds, tested to industry standards
- Slow the release of the system pressure
- Increase the gland fill while being careful not to exceed 90%
- Choose a higher modulus or harder elastomer.

Chloroprene (CR) (Neoprene - DuPont™)

-40°C to 121°C (-40°F to 250°F)

- Exceptional ozone and weather resistance
- Good chemical resistance, including to refrigerants (R12)
- Great mechanical properties are retained over a wide temperature range
- Commonly used with ammonia
- Poor resistance to aromatic hydrocarbons, polar solvents, and toluene

Ethylene Propylene (EPDM, EPM)

-54°C to 150°C (-65°F to 302°F)

- Excellent resistance to ozone, hot water, steam, and aging
- Commonly used with brake fluids and refrigerants
- Poor resistance to petroleum fluids and mineral oils

Fluorocarbon (FKM, FPM) (Viton™ Type A - Chemours)

-26°C to 204°C (-15°F to 400°F)

- Excellent resistance to higher temperatures, petroleum oils, and gasoline
- Wide range of chemical resistance
- Great ozone, weather, and aging resistance
- Poor compatibility with H₂S over 2%, amines, acetone, hot water, and steam
- Poor low temperature characteristics
- Low temperature compounds (Type 3 FKM) are available with a minimum temperature of -40°C (-40°F)

Fluorosilicone (FVMQ, FMQ)

-56°C to 204°C (-69°F to 400°F)

- Wide temperature range
- Excellent resistance to hydrocarbon fuels, petroleum oils, and silicone oils
- Relatively low tear strength, abrasion resistance, and tensile strength
- Generally, not suited for dynamic applications

Hydrogenated Nitrile (HNBR)

-40°C to 160°C (-40°F to 320°F)

- Nitrile based compound with improved chemical resistance
- Wider temperature range than standard nitrile
- High strength material that resists extrusion, abrasion, and wear
- Water and steam resistance to +149°C (+300°F)
- H₂S resistance up to 10%
- Commonly used with petroleum oils and CO₂
- Do not use with chlorinated hydrocarbons, polar solvents, or strong acids
- Low temperature compounds are available with a minimum temperature of -55°C (-67°F)

Nitrile (NBR)

-40°C to 120°C (-40°F to 248°F)

- Presently the most widely used rubber in the seal industry
- Exceptional balance of good mechanical properties, wear properties, and chemical resistance
- Resistant to most mineral oils and greases
- Do not use with glycol-based brake fluids and strong acids
- Low temperature nitrile compound available down to -55°C (-67°F)

Perfluoroelastomer (FFKM) (Kalrez® - DuPont™)

-32°C to 350°C (-25°F to 662°F)

- Broadest chemical resistance of any elastomeric material
- Combines the sealing integrity of elastomers with chemical resistance approaching that of PTFE
- Not suitable with liquid sodium and potassium, fluorinated solvents, and refrigerants
- Low temperature compounds available up to -42°C/-44°F
- Multiple grades available

Polyetheretherketone (PEEK)
(KasPex™ PEEK - Hi-Tech Seals Inc.)

-70°C to 260°C (-94°F to 500°F)

- Outstanding chemical resistance
- Excellent high temperature performance
- Exceptional wear and abrasion resistance
- High strength
- Maintains mechanical properties in high temperatures
- Commonly used for anti-extrusion purposes
- Do not use with hydrochloric, nitric, or sulphuric acids

Polytetrafluoroethylene (PTFE)

-260°C to 260°C (-436°F to 500°F)

- Virtually universal chemical resistance
- Very low coefficient of friction
- Reinforcements such as bronze, moly, glass, and carbon are commonly added to alter mechanical properties

Polyurethane (AU, EU)
(BoKure™ Urethane - Hi-Tech Seals Inc.)

-54°C to 105°C (-65°F to 221°F)

- Thermoplastic elastomer with higher tensile strength, toughness, and wear resistance
- Great combination of hardness and elasticity
- Excellent low temperature flexibility
- Commonly used in high-pressure hydraulic systems where parts are subject to wear

Silicone (VMQ)

-65°C to 232°C (-85°F to 450°F)

- Excellent resistance to oxidation and ozone degradation
- Wide temperature range
- Commonly used in static applications due to its poor tensile strength and wear resistance
- Popular for food and medical applications

Tetrafluoroethylene-Propylene Copolymer (FEPM, TFE/P)
(Aflas® FEPM - Asahi Glass Co.)

-9°C to 232°C (+16°F to 450°F)

- Good high temperature capability
- Resistant to strong acids and bases, amines, solvents, and hot water
- Found in numerous oilfield applications
- Poor low temperature performance and low resilience

Thermoplastic Elastomer (TPC- ET) (Hytrel® - DuPont)

-54°C to 149°C (-65°F to 300°F)

- Thrives in high temperatures and hostile fluids
- Excellent strength and toughness properties
- High resilience and flexibility which allows for easier installation than PTFE materials
- Not suitable with water and phosphate fluids above +80°C (+176°F)

Viton™ Extreme™ (FEPM) (Viton™ - Chemours)

-20°C to 204°C (-4°F to 400°F)

- Exhibits significantly improved performance over standard Viton™
- Provides excellent thermal resistance along with significantly advanced chemical resistance

* The material information provided is based on multiple industry accepted reference sources. It is intended to serve as a general guideline. Testing material in the application environment is highly recommended.
