

## Lease Site Designation Management System *Gasket Measuring*

Hi-Tech Seals offers gasket measuring field services for small and large sites. An experienced professional will visit the facility to identify and accurately measure your assets, then reverse engineer gasket measurements. Once complete, our manufacturing centre allows for the quick turnaround of replacement gaskets. The template and material type is then catalogued using the LSDS number to allow for easy future re-orders.

We stock a large selection of sheet material and can assist with choosing a material to extend the gasket's service life. Popular materials include composite non-asbestos, composite flexible graphite, Viton™/fluorocarbon, hydrogenated nitrile, and RyFlor™ RF40.

Along with our gasket measuring and manufacturing services, we can assist with future site turnarounds through the consolidation

of gaskets with other consumable and complimentary components. While on site, our professional can evaluate and integrate your cut gaskets, anodes, pigtailed, isolation kits, studs & nuts, and spiral wound gaskets into our unique Lease Site Designation Management System. Subsequent turnarounds would require reference to the site number for our staff to know which gaskets and consumables are required.

If required, field service technicians can measure multiple sites during one visit. For more information, contact a Hi-Tech Seals professional today, or email us at [info@hitechseals.com](mailto:info@hitechseals.com).
